

TB30 Administrator Guide

SIP STACK
VERSION 1.3
9 September, 2010

European Community Declaration of Conformity

This equipment complies with the requirements relating to electromagnetic compatibility, EN55022 Class B for ITE and EN55024.

This meets the essential protection requirements of the European Council Directive 89/336/EEC on the approximation of the laws of the Member States relating to electromagnetic compatibility. Technicolor declares that this TB30 IP Phone is in compliance with the essential requirements and other relevant provisions of Directive 1999/5/EC.

You can download the declaration of conformity on www.thomsonbroadbandpartner.com.

The CE logo involves the conformity of the product with the essential requirements of implemented directives.

Northern America Federal Communications Commission (FCC) Statement

This equipment generates, uses and can radiate radio frequency energy and, if not installed and used in accordance with the instructions in this manual, may cause interference to radio communications. This equipment has been tested and found to comply with the limits for a Class B digital device pursuant to Subpart J of Part 15 of FCC rules, which are designed to provide reasonable protection against radio interference when operated in a commercial environment. Operation of this equipment in a residential area is likely to cause interference, in which case the user, at his own expense, will be required to take whatever measures are necessary to correct the interface.

Part 1 Safety Information

Operating conditions

This telephone is to be operated on a local area network. The telephone must be equipped with the appropriate software version. This guide is written for the actual version of firmware v1.72

Caution

Read these instructions carefully before connecting the SIP phone to its power source.

Location safety instructions

Do not expose the IP Phone to fire, direct sunlight or excessive heat.

Do not expose the IP Phone to rain or moisture and do not allow it to come into contact with water.

Do not install the IP phone in an environment likely to present a THREAT OF IMPACT.

The IP phone must be installed at least 1 meter from radio frequency equipment, such as TVs, radios, hi-fi or video equipment (which radiate electromagnetic fields).

The IP phone is designed to work in temperatures from 0°C to 40°C.

Care

You may clean the IP phone using a fine damp cloth. Never use solvents (such as trichloroethylene or acetone), which may damage the phone's plastic surface and LCD screen. Never spray the phone with any cleaning product whatsoever.

Connections

Equally, incorrect reassembly could cause electric shock on re-use of the appliance.

The IP Phone must be powered using the power adaptor or PoE.

If you do use an alternative power adaptor, it must comply with the following standards:

- EN60950, CE mark, U/L
- Output: 12VDC /1A.

Any damage caused to the IP Phone as a result of using unsupported power adaptors will not be covered by the manufacturer's warranty.

Do not connect the LAN/PC ports to any network other than an Ethernet network.

Do not work on the system or connect or disconnect cables during lightning storms.

Before working on any system fitted with an ON/OFF switch, turn OFF the power and unplug the power cord.

Qualified service

No repair can be performed by the customer, if you experience trouble with this equipment for repair or warranty information, please contact your administrator.

Technicolor disclaims all responsibility in the event of use that does not comply with the present instructions.

Product disposal warning:

Ultimate disposal of this product should be handled in accordance with national laws and regulations.

Information regarding the products in this manual is subject to change without notice. This guide is believed to be accurate but is presented without warranty of any kind, express or implied. The usable services and features on the phone depend on the installed software release and on call manager. Therefore, the conformity of the admin guide cannot be guaranteed.

Part 2 Product overview and connections

Introduction

This administrator guide describes how to set up, connect cables, and configure your TB30 SIP Phone. It also provides information on how to configure the Network settings and change the settings of your IP Phone. The administrator guide also includes the way to view and upgrade the firmware.

Note and Caution

Note and **Caution** in this manual are highlighted with graphics as below to indicate important information.

Note

Contains related information that corresponds to a topic.

Caution

Represents essential steps, actions, or messages that should not be ignored.

Package contents

1. IP phone base unit
2. Handset
3. Stand
4. Coiled handset connecting cord
5. Quick installation and user guide
6. 1 Ethernet cable

Not included: Ethernet cable to connect any PC to the telephone through its PC switch

Optional:

1. Extension module
2. Headset
3. Power supply : model IU18-312100-WP

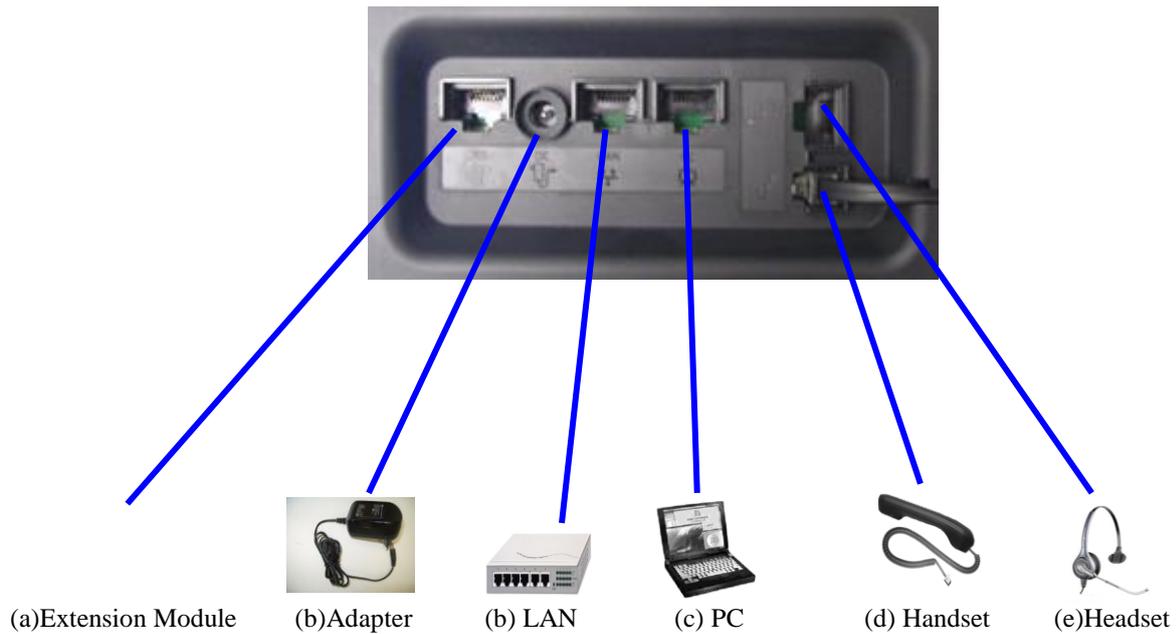

Figure 1 IP Phone Cable Connections

Connecting to the Network and the PC

The SIP Phone has 2 RJ-45 ports that each support 10/100 Mbps full duplex Ethernet connection to external devices- Network port and access port (one for PC and one for LAN).

➤ Network Port (10/100LAN)

Use the Ethernet cable to connect the LAN port to an Internet equipment, such as a hub, switch. Or directly to the Network. In Power over Ethernet (PoE) office environment, the IP phone can be powered from a switch via Ethernet cable, in which case the external power adaptor is not needed.

➤ Access port (10/100PC)

Use the Ethernet cable to connect a network device, such as a computer to the PC port on the back of your phone.

Powering up the Phone

The TB30 could be powered by either a main power unit, or PoE. Its power consumption is under 15.4W(PoE class 3).

➤ Power Plug

The power plug is fed with 12VDC, 1A switching adapter.

The power plug unit will be adapted specifically to the target country requirements:

- EU plug for Europe

- US plug for US, Japan and North America

- UK plug for UK and Hong Kong

- Australian plug for Australia and New Zealand

- China plug China

➤ Power Over Ethernet

The TB30 supports PoE as defined by 802.3af Standard. It is class 3, and supports class negotiation (in order to plug as many devices as possible on a PoE hub). It can be powered with PoE up to 100 meters with category 5,5e or 6 cables.

Connected a headset

If you will use a headset, plug the RJ45 headset connector into the headset jack port on the back of your IP Phone (see the Figure 1)

If your external headset supports Electronic Hook Switch (EHS) following DHSG protocol, you can use your compatible Jabra wireless headset to answer the phone remotely. Just activate your headset when you hear the ringer and the handset off-hook to connect the call.

You can use EHS (following DHSG protocol) with your compatible Jabra wireless headset (e.g. Jabra GN9350e) to answer the phone remotely.

Connection

Plug the RJ45 headset connector into the headset jack port on the back right side of your IP Phone.

Figure 2 Headset Connection

Headset Compability.

TB30 supports Jabra and Plantronic headsets.

RJ9			Pin-1	Pin-2	Pin-3	Pin-4		
RJ45	Pin-1	Pin-2	Pin-3	Pin-4	Pin-5	Pin-6	Pin-7	Pin-8
TB30 handset			MIC+	SPK-	SPK+	MIC-		
TB30 headset	DTX	GND	MIC-	SPK+	SPK-	MIC+	3V3	DRX

Table 1 Handset/Headset pin

Jabra Headset Compatibility: To be confirm.

Plantronics Headset Compatibility: <http://www.plantronic.com/compatibility>

- PROFESSIONAL CORDED H-Top HEADSETS with Quick Disconnect plug and U10P-S19 RJ45 bottom cable.
- PROFESSIONAL WIRELESS HEADSETS with electronic hookswitch cable

AUX Wireless headset setup

You can use EHS (following DHSG protocol) with your compatible wireless headset to answer the phone remotely. Please read wireless headset's user manual and set it to **DHSG** mode.

Using headset

Answer and end calls

- Headset key on phone keypad
- Talk button (EHS): build-in electronic hook switch (wireless headset only)

Overview

TB30 SIP is a VoIP Phone that can be plugged directly into an IP Network and used very much like a standard private branch exchange (PBX) telephone. TB30 is an IP telephony instrument that can be used in a VoIP environment. The product is to be connected only to Ethernet networks without routing to the outside plant.

The TB30 IP phone is compliant with SIP protocol.

Main Features

- 6-line LCD display
- Font supports ISO8859-2, ISO8859-5, ISO8859-8
- Connectivity: Integrated 2 ports 10/100 Ethernet switch
- Phone services:
 - Multilines (up to 9), Call Forward, Call Transfer (attended), Call Hold, Redial
 - Group listening, Hands free
 - Message Waiting Indicator
 - Speed dial, Conference call
 - Phonebook, Call logs
 - Caller ID display
- Audio extension connection: Integrated headset RJ45 port
- Multiple power options: power over Ethernet 802.3af or external power supply adaptor
- VoIP Standard: SIP V2 (RFC 3261)
- Web browser interface for configuration

Note

This administrator guide is based on firmware v1.72, you can download the latest administrator guide on:

www.thomsonbroadbandpartner.com

Supported Features

In addition to the physical features illustrated in Figure 1 and table 1, your TB30 also provides the following:

Technical specifications:

- An integrated 2 Ethernet ports switch that allows the telephone and a computer to share a single Ethernet jack.
- A direct connection to a 10BaseT or 100Base100BaseT Ethernet (RJ45) network (half or full duplex connections are supported).
- G.711, G.723, G.729ab, G.722, L16 & ILBC voice compression standards
- In band Dual-Tone Multi Frequency (DTMF) support for touch-tone dialing
- Out-of-band DTMF signalling for codecs that do not transport the DTMF signalling correctly (for example, G729 or G729a)

Configuration:

- IP Number addressing: manually configured via local setup menu, static or dynamic IP configuration (integrated Dynamic Host Configuration Protocol DHCP)
- Configuration support:
 - Local & remote warm reboot
 - Network start up via DHCP and TFTP (Trivial File Transfer Protocol)
 - TFTP/HTTP sever download
 - Web browser management
 - Password protection for configuration

Phone set function support and Call Options:

- Call hold, Call Transfer, Call Forward, Conference Call, Call Park and Call Pick-up.
- On-hook dialing, Dial from call log, multi line (10 lines)
- Redial, Mute, Call log, phone book (30 entries), 10 Speed dial memory keys
- Hands free (full-duplex)

Supported Protocols

Your TB30 SIP Phone supports the following standard Internet protocols:

- **Internet Protocol (IP)**
IP is a network layer protocol that sends datagram packets between nodes on the Internet. IP also provides features for addressing, type-of-service (ToS) specification, fragmentation and reassembly, and security.
- **User Datagram Protocol (UDP)**
UDP is a simple protocol that exchanges data packets without acknowledgments or guaranteed delivery. SIP can use UDP as the underlying transport protocol. If UDP is used, retransmissions are used to ensure reliability.
- **Trivial File Transfer Protocol (TFTP)**
TFTP allows files to be transferred from one computer to another over a network.
- **Dynamic Host Control Protocol (DHCP)**
DHCP is used to dynamically allocate and assign IP addresses. DHCP allows you to move network devices from one subnet to another without administrative attention. If using DHCP, you can connect TB30 IP phone to the network and become operational without having to manually assign an IP address and additional network parameters.
- **Domain Name System (DNS)**
DNS is used in the Internet for translating names of network nodes into addresses. Sip uses DNS to resolve the host names of end points to IP addresses.
- **Hyper Text Transfer Protocol (HTTP)**
HTTP is the underlying protocol used by the World Wide Web. It defines how messages are formatted and transmitted, and what actions Web servers and browsers should take in response to various commands.
- **Simple Network Time Protocol (SNTP)**

SNTP is a simplified version of NTP. SNTP can be used when the ultimate performance of the full NTP implementation described in RFC 1305 is not needed or justified.

- **Network Time Protocol (NTP)**

NTP is an Internet standard protocol that assures accurate synchronization to the millisecond of computer clock times in a network of computers. NTP sends periodic time requests to servers, obtaining server time stamps and using them to adjust the client's clock.

- **Simple Network Management Protocol (SNMP)**

SNMP is a set of protocols for managing complex networks. It works by sending messages, called protocol data units (PDUs), to different parts of a network. SNMP-compliant devices, called agents, store data about themselves in Management Information Bases (MIBs) and return this data to the SNMP requesters.

- **Address Resolution Protocol (ARP)**

ARP is a network layer protocol used to convert an IP address into a physical address (called a DLC address), such as an Ethernet address. A host wishing to obtain a physical address broadcasts an ARP request onto the TCP/IP network. The host on the network that has the IP address in the request then replies with its physical hardware address

- **Transmission Control Protocol (TCP)**

TCP is one of the main protocols in TCP/IP networks. Whereas the IP protocol deals only with packets, TCP enables two hosts to establish a connection and exchange streams of data. TCP guarantees delivery of data and also guarantees that packets will be delivered in the same order in which they were sent.

- **Session Description Protocol (SDP)**

SDP is a protocol that defines a text-based format for describing streaming media sessions and multicast transmissions. SDP is not a transport protocol but a method of describing the details of the transmission. For example, a SDP file contains information about the format, timing and authorship of the transmission, name and purpose of the session, any media, protocols or codec formats, the version number, contact information and broadcast times.

- **Technical Report 069 (TR069)**

TR069 is a Broadband Forum technical specification entitled CPE WAN Management Protocol (CWMP). It defines an application layer protocol for remote management of end-user devices. It includes both a safe auto configuration and the control of other CPE management functions within an integrated framework. Using TR-069 the terminals can get in contact with the Auto Configuration Servers (ACS) and establish the configuration automatically.

Abbreviations

SIP	S ession I nitiation P rotocol. An IP telephony signalling text-based protocol developed by the IETF
DNS	D omaine N ame S erver
DHCP	D ynamic H ost C ontrol P rotocol

TFTP	T rivial F ile T ransfer P rotocol
XML	E Xtensible M arkup L anguage
DTMF	D ual T one M ulti- F requency The system used by touch-tone telephones. DTMF assigns a specific frequency (consisting of two separate tones) to each key so that it can easily be identified by a microprocessor.

Part 3 Phone operations

General appearance

The general appearance of the TB30 is as below:

Figure 3 TB30 General Appearance

Physical Features

Figure 4 and Table 1 illustrate physical features of the TB30 SIP Phone:

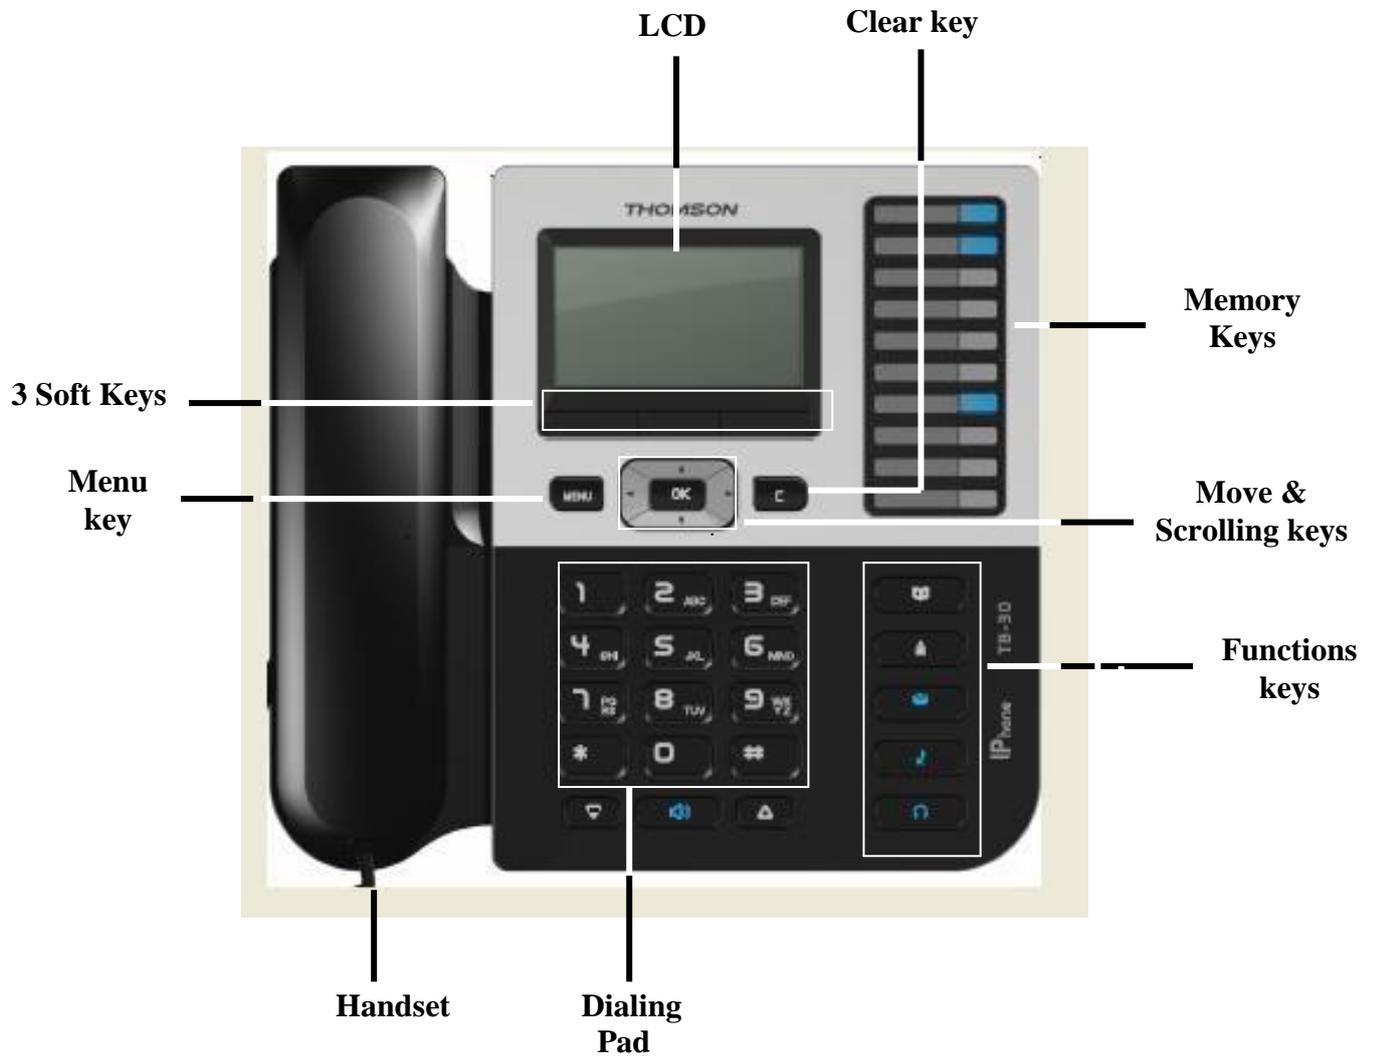

Figure 4 TB30 User Panel

Display keys

	Confirmation key:
	Clear key: Clear characters in editing mode or exit to standby display (long click) or return back to the previous page.
	Menu key: Enables access to menu
	Phone book key: Enables to access the phonebook and view the names and phone numbers the user wants to dial.
	Scrolling and move keys: Enable browsing setting options, display the latest 30 call numbers in standby mode and move among soft keys options in editing mode.
	3 Soft keys: Activate the features described by the text message directly above on the LCD screen.
	LCD Screen: Displays information about the phone settings, such as the number dialing out or calling in, date, time, calls status, call duration timer etc. It is a 6-line of 20 characters LCD screen.

Audio keys

	Volume keys: Adjust the volume of the handset, headset, speaker phone, ringer phone.
	
	Speaker key: Activates/disables hands free or group-listing function and switch on/off the microphone
	Headset key: Activates headset mode during a call

Mute key:
Activates/deactivates mute function.

Voice Mail key:
Voice Mail Function

Dialing keys

Dialing pad
Press the dial pad buttons to dial a number. Dial pad buttons work exactly like those on your existing telephone. In the editing mode, it can be used to input characters.

Redial key:
Calls the last number dialed.

Memory keys:
Are used as Speed dial keys.

Handset:
Makes and receives calls

Table 2 TB30 Physical Features

Display

The product has a full dot matrix LCD screen with a resolution of 240 x 120 pixels. Its screen is monochrome and with backlighted.

The viewing area of the screen is 75 x 40 mm (active area: 72 x 36 mm).

Definitions of Soft Keys

The table 2 describes the main functions of each soft keys you can use on the SIP phone.

Soft Key	Brief Description
A>a>1	Input mode switch in edit state
Active	Activate option/service
Admin	Enter to administration sub-menu
Answer	Answer an incoming call
Anym	Shortcut to “Anonymous”
Autoan	Shortcut to “Auto Answer”
Back	Return to previous menu
CalLog	Shortcut to Call log

Extension module

The extension module features 36 keys. One can plug up to 2 extension modules in a row, leading to a total of $10 + 2 \times 36 = 82$ possible “multiline” keys.

Memory

The TB30 has 8MB of Flash, and 32MB of RAM

Power supply

The TB30 could be powered by either a main power unit or PoE. The power plug and PoE can be plugged at the same time. The power plug has priority, and PoE takes over in case of power failure. Its power consumption is under 15.4W.

Reject a call

- Press **Reject** when the phone is ringing

Call back

Executes Auto Call Back when the called party is busy or does not reply.

ringing on any other station within his own predefined “pickup group”

When you fail to make a call due to destination is “Busy”, you can activate callback function to complete the call automatically in standby mode.

Press **Menu** and **Option** then select "DialSubscribe" to view the status.

You can do modifications by pressing **Change** to enter the phone number you want to auto call back, the time of the call and the status.

Operation of Call Completion to Busy Subscriber (CCBS)

- Place a call and you hear busy tone
- Press soft key **CBack**
- Replace handset (i.e. Go on-hook, and CCBS is activated)

When CCBS is successful

- The phone is ringing
- Go off-hook.
- You hear ring-back tone if party doesn't answer yet. Or start conversation if party answers the call.
- The party will hear ring-back tone, if you don't go off-hook yet.

You can cancel CCBS function by any one of following ways.

- Go off-hook
- Press any digital key

Call forward

The function of the Call Forward processed the line forwarding to another phone number. The user can set the system to another phone number. When a call is coming, the system will forward the line to another phone number that is set previously. The system supports three kinds of ways to implement this function including "Unconditional", "Busy", and "No Answer".

Unconditional: Provided that a call is coming, the system will forward the line immediately.

Busy: A call is coming and the user is on a busy line. Then, the system will forward the calling line.

No Answer: On condition that the user does not respond to the calling for 30 seconds, the system will forward the line to another phone number.

Press **Menu** and **Option** and select "Call Forward" to view the status of Call Forward you have.

You can change this status by pressing **Change**.

Enter the phone number towards which you want to forward your calls.

Once this process is completed, press up/down of the cursor to the Call forward type.

Finally, press **Save**.

Transfer Message to Voice Mail

You can transfer all the calls you receive to your Voice Mail.

Press **TrMail**, then activate the transfert of your messages to your Voice Mail Box.

Press **Change** until obtaining "TrToVoiceMail-ON",

finally validate it by pressing **OK**

Call functions during conversation

Hold and Retrieve a call

- During a call, press **Hold** to put a call on hold.
- Press **Unhold** to retrieve a held call.

Call Transfer

During conversation mode, you can press the soft key **Transf** to activate Call-Transfer service.

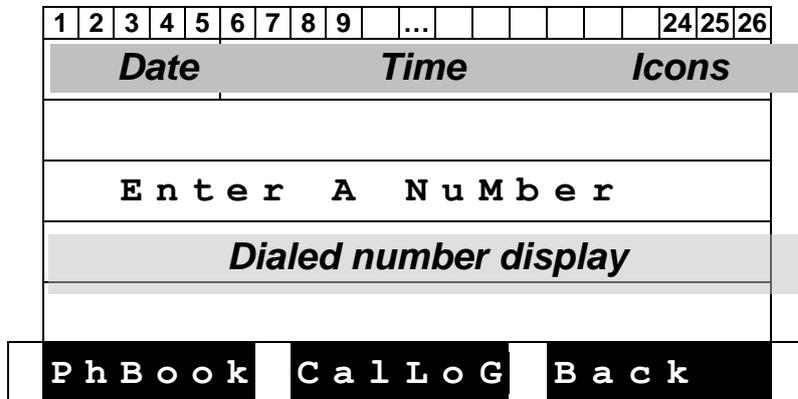

Operation of “Blind” transfer

- Press **Transf**
- Dial the desired phone number to which you want to transfer the current call
- Press **Transf**
- Hang Up

Operation of “Attended” transfer

- Press **Transf**
- Dial the desired phone number to which you want to transfer the current call
- Wait for the transfer recipient to answer.
- Press **Transf**, if the recipient accepts the transferred call.
- Press **Back**, if the recipient refuses the transferred call.

After pressing once **Transf**

- Hold: hold line
- R-Bye: remote terminates the line
- R-Hold: remote side holds the line
- Conf: conference call

Switch Between Line/Call

The IP phone supports up to 10 multi-lines that is configurable by administrator. Each line can be switched by pressing line keys (i.e. keys **F1 – F10**). Besides the current active line, all others are held by IP phone and can be resumed by pressing associated line key or pressing proper soft key. And the first call is always assigned to line 1.

Press active line key will terminate the call.

<For example >

When you are communicating with one party and wish to make a brief to another party.

- Press a free line key (then you will hear dial tone, and the original call is held)
 - Key in number you want to call
- Or
- Press **NewCall** (then you will hear dial tone, and the original call is held)
 - Key in number you want to call

Answer an incoming call when another call is active.

- The phone will assign a free line dedicated to the incoming call, and the associated LED will blink fast.
 - Press the line key, and the original line is held by phone automatically
- Or
- Scrolling the ringing line
 - Press **Answer** to answer the call

Switch between lines.

- Press the line key you desire, and the original line is held by phone automatically
- Or
- Scrolling to the line
 - Press **UnHold** to resume the call

Pick up

A station user may dial a special code to answer any incoming calls

- Use menu (table, arborescence)
- Use HD, SP, HD, Adjust volume

To pick up call on another phone.

- Press **PickUp** key in standby mode
- Key in the phone number. You are connected with the caller.
- Press OK

Park up

Somewhat similar to the Call Hold feature; however, once a call is placed in the “park” condition, any station within the system may retrieve it by either dialing the appropriate access code.

Park a call at the phone, and resume the call at another phone.

Set Call park

- Press **Park**
- Replace the handset

Retrieve Call park on an other phone

- Press **RtPark** in standby mode
- Key in the parked phone number
- Press OK

Phone book & Call log

Call logs

Press **CalLog** to view, add, clear call logs and dial from call logs.

There are 3 kinds of call logs: Missed call logs, Received call logs and dialed call logs.

You can also dial from call logs by pressing **OK** on selected call.

Key Pressed	LCD display

- The reminding message “**Have X missed calls**” is always displayed in standby mode till you press softkey **MsCall**, **Back** or **Cancel** key.

Received Call & Dialed Calls

Be the same as operation of Missed Calls

Phone book

Press **B** to access the phone book.

You can view, delete and add phone numbers in the phonebook.

You can also dial from phonebook.

	1	2	3	4	5	6	7	8	9	..					24	25	26
Line 1	Date				Time												
Line 2																	
Line 3																	
Line 4																	
Line 5																	
Line 6	View				Dial				Delete								
	Add								Back								

The user is able to search and retrieve a phone number without having to scroll between all the entries by typing on a letter. For instance, if the user presses quickly 2 times on key ‘2’ (corresponding to ‘b’ letter), the first name beginning with ‘b’ will be displayed on top of screen.

When pressing feature key, then replace current memory display by item to be memorized is displayed. And corresponding softkeys **Replace**, **Edit** and **Back** are displayed. Edit function is for editing the feature key.

Content of Phone book entry

Item Name	Data Format	Options List	Max. Length	Comment
Name	Alphanumeric		20	
Number (TelNbr)	numeric		24	While length of number is more than that LCD can display, press “←” “→” to get rest.
RingType (Bell)	Options	Ringer-1 Ringer-2... Ringer-n Music-1 Music-2		

Character Input- Edit Mode

The editor is automatically activated whenever you are modifying content of configurable parameters. Apart from entering characters, you can use this editor to navigate through text or delete characters. Even though the maximal text length is not limited by the number of characters on the display because the text can be shifted to the left and right, there are limits for the certain scenarios. E.g. for phone book name, the limit is 15. For number, it is 31. For IP address, it is 15. The following overview shows all characters that can be entered. Number keys must be repeatedly pressed until the required letter appears; the cursor advances after a short delay (one second) or pressing any other key(0..9,*,#, up, down etc.) indicating that the required letter has been accepted.

Key	Lower case	Upper case
1	1 . , = + - & ^	
2	a b c 2 à á â ã ä å ç	A B C 2 Ä Å Æ
3	d e f 3 è é ê ë	D E F 3 É
4	g h i 4 ì í î ï	G H I 4
5	j k l 5	J K L 5
6	m n o 6 ñ ò ó ô õ ö ø	M N O 6 Ñ Ø
7	p q r s 7	P Q R S 7
8	t u v 8 ù ú û	T U V 8 Ü
9	w x y z 9 ÿ	W X Y Z 9
0	0 Space @ % () [] < >	
*	* # ? ! ; : ‘ “ _ /	
#	#	

Note

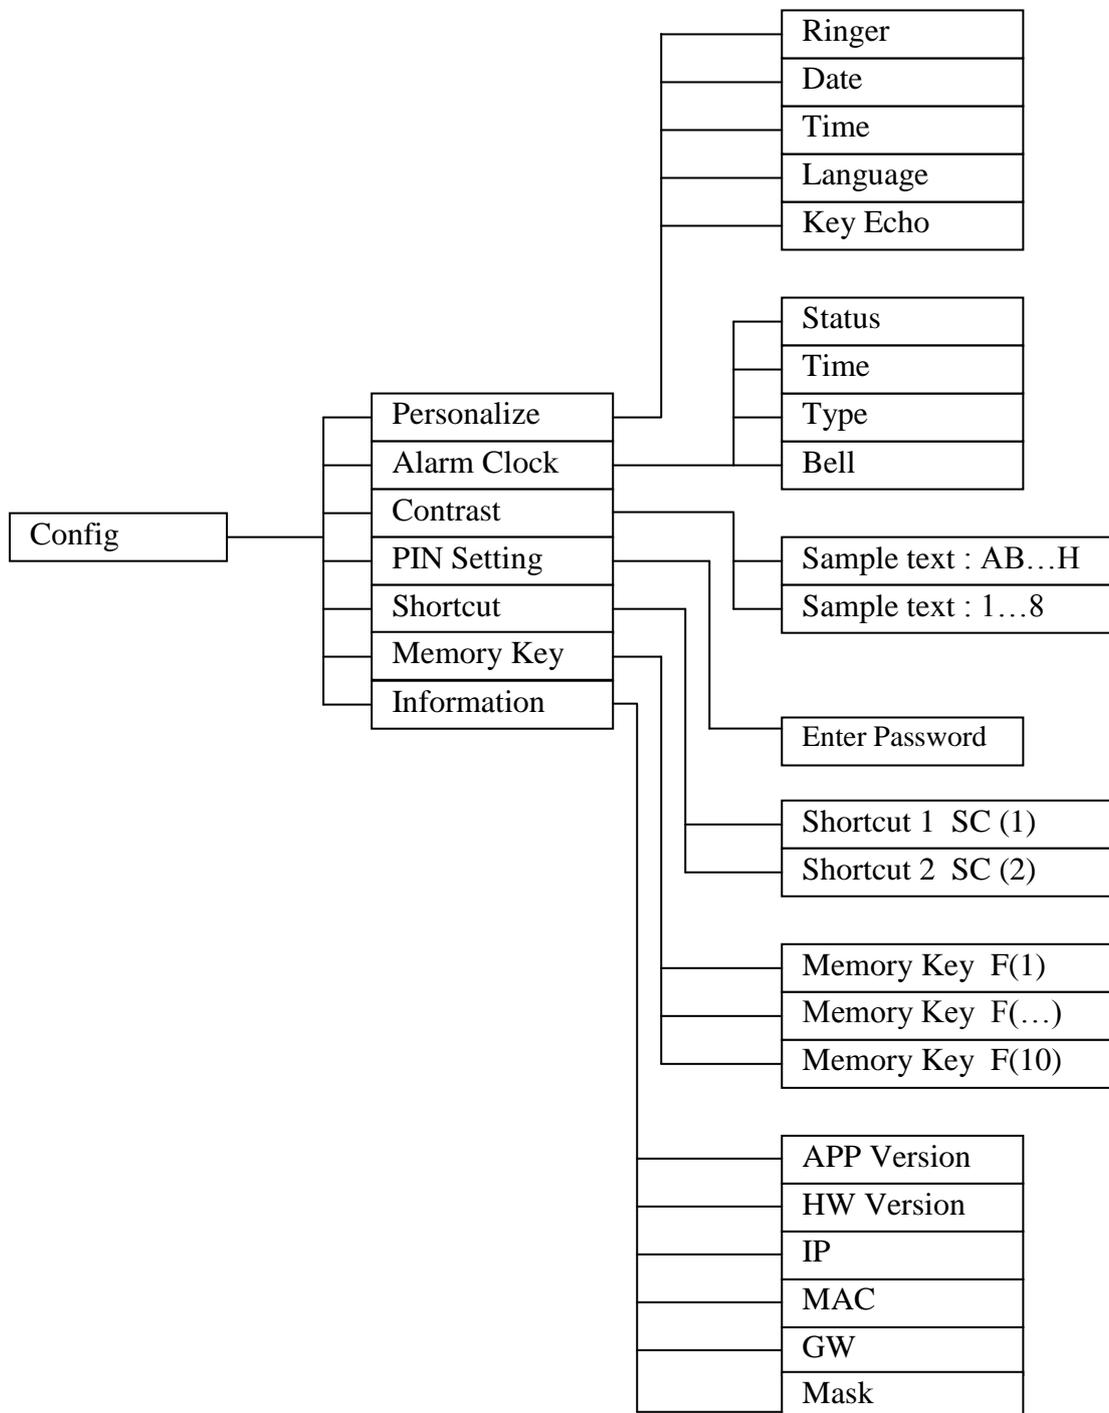

Softkey **ABab12** : Switch uppercase (with indicator “>ABC”), lowercase (with indicator “>abc”) and numeric (with indicator “>123”) when entering letters.

All other symbol needed will be appended to ‘*’ key.

Part 6 Configuration via Web Interface

Configuration through the Web interface

The phone can also be configured using the web browser. It has a friendly web interface to set and modify parameters.

Step 1 – Before starting

The IP phone should be connected to the Network and then be powered it up before the connection to the web server.

Step 2 – Connect to the IP Phone web server

- 1) Start a web browser session
- 2) Input the phone's IP address into the address field.
For example:
 - i. <http://10.1.97.6> for user mode.
 - ii. <http://10.1.97.6/admin.html> for admin mode.
- 3) Enter the username (by default: administrator)
- 4) Enter the password (by default: 784518)
- 5) Once the process is completed, you can change the settings values to your convenience.

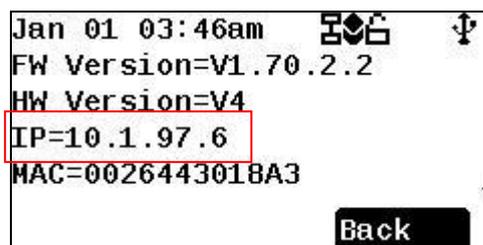

Step 3 – Reboot the phone

Some parameters will require the phone to be rebooted for changes to be operated. The web pages below will be displayed once you have input the phone's IP address into the address field.

Find IP Address

There are two ways to check the phone IP address.

- Long press **MENU**
- Press **MENU** to enter operation manual. Press **Config** soft key and then choose « Information »

Detailed Web pages

There are two mode of web pages – user mode and admin mode

To access user mode, you just type the IP address in your browser. In user mode, many setting are not available.

(e.g. http://192.168.1.100)

To access admin mode, you type the IP address and the admin.html in your browser.

(e.g. http://192.168.1.100/admin.html)

Please find below the web pages related to the configuration of phone settings via web interface

Part 7 Auto-Provisioning

The **automatic provisioning** requires one DHCP server and one HTTP/TFTP server.
 The **USB automatic provisioning** requires one USB disk.
 Please find below the way to provision your IP Phone.

Automatic phone provisioning with TFTP

The automatic phone provisioning is particularly adapted to the provision of several phones at the same time, of any large-scale deployment environment. Auto-provisioning is achieved using 2 well-known protocols: Dynamic Host Control Protocol (DHCP) and Trivial File Transfer Protocol (TFTP).

Simply follow next steps to provision your IP Phone:

Needed:

- 1 DHCP server which one can manage the options**
- 1 TFTP server**
- 1 TB30 (SIP or MGCP)**

Several files which one can need (correctly filled) are:

- SIP:**
- File INF
 - Firmware
 - File « common_config »
 - File MAC specific
 - File « Telconf »

- MGCP:**
- File INF
 - Firmware
 - Files Deck
 - File« common_config »
 - File MAC specific
 - File « TelConf »

(See examples of these files in Appendix.)

The files:

File INF: (extension .txt or .inf) inform about the place of the various files to download (relative way or absolute)

Firmware: Version’s code which needs to be upgrade by the phone

File “common_config”: (extension.txt) informs the phone about configurations which need to be upgrade on the level network, sip (or mgcp), auto provisioning, etc...

File MAC: (extension.txt). Same that the file “common_config” but its name is based on phone’s MAC address which needs to be upgrade and the configuration which is made inside will concern only the phone which has this MAC address. It has priority if the two files are on TFTP server.

File “TelConf”: (extension.txt), a set of audio parameters, which configures the phone for the audio performance.

Files Deck: (ONLY MGCP) (extension .thd), allow phone to know how to display some flows (xml) on screen. Generally, it’s files which are sent via the operator chosen to connection to the service.

We provide often to the customer only the upgrade firmware. The other files are normally managed by the administrator who takes care of the procedure of auto provisioning.

DHCP option:

Option 66: IP address of TFTP server where are the files which need to be downloaded.

Option 67: File INF’s name on TFTP server

Option 150: IP address of TFTP server used if this option (optional) is in DHCP options

Option 43: Used to http upgrade. If options 66 or 150 are not present, option 43 will be selected.

Option Next server Address: IP address of TFTP server used in some case when the other options are not manageable but this one yes.

Put in the following way in the file of configuration of DHCP (dhcpd.conf)

```
option tftp-server-name "@IP serveur TFTP";           -----> option 66
option bootfile-name "nomDeFichierINF.txt";         -----> option 67
option provision-server-ip code 150 = text;         ----->option 150 is text, not binary mode
option provision-server-ip "@IP serveur TFTP ";     -----> next server address
option vendor-encapsulated-options "http://192.168.70.10/swupgrade\_TB30m.txt" ---->option 43
```

Installation of the platform

Installation of the DHCP server

To set up all the necessary options (option 66 and 67)

Installation of the TFTP server

To put in the repertory of the TFTP server the last version of the firmware

Provisioning process

Process of auto provisioning in the theory:

At the time of the connection of a phone to the network, it will ask an IP address to DHCP server. This one will provide him an IP address but also the address of TFTP server where file INF is. This file will indicate on the phone the configuration file names which it must upgrade.

Process of auto provisioning in the practice:

1. Do not connect the phone with electricity. To put the cable (RJ45) in the Ethernet LAN port at the back of the phone.
2. Restore the default parameters. With this intention, it is necessary to maintain inserted the keys "headset" (ear-phone) and "transfers" (dumb) of the phone.
3. Connect phone with electricity.
Maintain the keys "headset" (ear-phone) and "transfers" (dumb) of the phone inserted, until seeing that the provisioning is carried out.
4. The phone will start (it will recover an IP address by DHCP server, the IP address of TFTP server and the name of file INF which will be downloaded) and will begin the process of auto provisioning.

1. In the order:

- Remote loading of file INF
- Remote loading of the firmware
- Reboot
- 2nd Remote loading of file INF
- Remote loading of the file TelConf
- Remote loading of the file Common_config
- Attempt of remote loading of the specific file MAC if he is
- Reboot
- Remote loading of file INF
- 2nd Attempt of remote loading of the specific file MAC if he is
(Remote loading of the files Deck for MGCP)

2. The phone is connected to the service of the operator.

Some precise details:

If phone doesn't receive an IP address, you need to check up that the parameter Mode→DHCP is activated

The file "Common_config" will be downloaded only if the file's name has been change compared to the last upgrade.

The specific file MAC is downloaded (if there exists) if his parameter "config_sg" was incremented.

It is imperatively necessary to download the file TelConf before returning it to the customer.

It is possible to pass from a phone SIP and quite simply to transform it into MGCP (but not the reverse) by providing on phone SIP a firmware corresponding to MGCP protocol as well as the good files which go with.

Automatic phone provisioning with HTTP

Also the provisioning can be carried out via HTTP. For that, it is necessary to follow following steps

Needed :

- 1 router DHCP
- 1 TB30 (SIP or MGCP)
- The last version of the firmware

Process of auto provisioning in the theory:

At the time of the connection of a phone to the network, it will ask an IP address to DHCP server. This one will provide him an IP address. While going on the WEB interface of the phone in mode *admin*, you can upgrade the firmware.

Process of auto provisioning in the practice:

1. Do not connect the phone with electricity. Connect an end of the cable (RJ45) in the Ethernet LAN port at the back of the phone and the other end is plugged into the router DHCP.
2. Restore the default parameters. With this intention, it is necessary to maintain inserted the keys "headset" (ear-phone) and "transfers" (dumb) of the phone
3. Connect phone with electricity.
Maintain the keys "headset" (ear-phone) and "transfers" (dumb) of the phone inserted, until seeing that the provisioning is carried out.
4. The phone not having for the moment anything with provision and no gateway to connect itself, it will continue to blink.
5. Find the phone IP address (provided by router DHCP). So :

If MGCP phone :

- Press on the key *menu* of the phone
- Press on the softkey *admin*
- Press on the button *OK* of the phone
- Select *Network configuration* while going down with the arrows
- Select *IP address* and note the address indicated

If SIP phone:

- Press on the key *menu* of the phone
- descend the cursor using the low button until *Information*
- Select *Information* and note the IP address indicated

6. Open a WEB browser (Internet Explorer, Mozilla,...)

7. Enter the bar of address : [IPaddressofphone/admin.html](#)

The IPaddressofthehone being that noted in (5).The Web interface appears.

8. Login is : administrator
Password is: 784518

9. Select « UTILITY ».

10. Select « Firmware Update »

11. In the box Firmware Update Using leave "HTTP" and click on the button "Browse..."
In the window which opens, select the version of the firmware to be installed.

12. Press « Apply »

13. The phone will normally reboot.

14. Start again from step 7) to step 11). Select « Telephone Configure »

15. In the box Firmware Update Using leave "HTTP" and click on the button "Browse..."
In the window which opens, select the file TelConf to be installed.

16. Press « Apply »

17. The phone will normally reboot.

18. Start again the process (find IP address, open WEB interface as admin). On the banner page of the WEB interface, you should see the firmware's version of the phone. Look in « System Information », at the line « APP Version ».

Caution: the main power supply must not be interrupted during the booting session. The phone could be damaged.

[Note]: when you want to upgrade the firmware or download a new configuration, you have to follow steps 1 and 2 and reboot the phone from its web-based interface.

USB Automatic phone provisioning

USB automatic phone provisioning is one of the simply way to upgrade firmware or other config when that has no network environment. USB auto-provisioning is achieved using usb device.

Simply follow next steps to provision IP Phone:

Needed:

1 USB Disk

1 TB30 (SIP or MGCP)

Several files which one can need (correctly filled) are:

SIP: File INF (TB30S.INF)
 Firmware
 File « common_config »
 File MAC specific
 File « Telconf »

MGCP: File INF (TB30M.INF)
 Firmware
 Files Deck
 File« common_config »
 File MAC specific
 File « TelConf »

The files:

File INF: (TB30S.INF for SIP, TB30M.INF for MGCP) inform about the place of the various files to download (relative way or absolute)

Firmware: (extersion .zz) Firmware, DSP and/or Boot code which needs to be upgrade by the phone

File “common_config”: (extension .txt) informs the phone about configurations which need to be upgrade on the level network, sip (or mgcp), auto provisioning, etc...

File MAC: (extension .txt). Same that the file “common_config” but its name is based on phone’s MAC address which needs to be upgrade and the configuration which is made inside will concern only the phone which has this MAC address. It has priority if the two files are on TFTP server.

File “TelConf”: (extension .txt), a set of audio parameters, which configures the phone for the audio performance.

Files Deck: (ONLY MGCP) (extension .thd), allow phone to know how to display some flows (xml) on screen. Generally, it’s files which are sent via the operator chosen to connection to the service.

Process of auto provisioning in the theory:

Plug in USB disk at the time of boot up, it will search INF file in root path. This file will indicate on the phone the configuration file names which it must upgrade.

Process of auto provisioning in the practice:

1. Do not connect the phone with electricity. To put the cable (RJ45) in the Ethernet LAN port at the back of the phone.
2. Restore the default parameters. With this intention, it is necessary to maintain inserted the keys "headset" (ear-phone) and "transfers" (dumb) of the phone.
3. Plug in USB disk
4. Connect phone with electricity. Maintain the keys "headset" (ear-phone) and "transfers" (dumb) of the phone inserted, until seeing that the provisioning is carried out.
5. The phone will start (the INF which will be downloaded) and will begin the process of auto provisioning.

In the order:

- Remote loading of file INF
- Remote loading of the firmware
- Reboot
- 2nd Remote loading of file INF
- Remote loading of the file TelConf
- Remote loading of the file Common_config
- Attempt of remote loading of the specific file MAC if he is
- Reboot
- Remote loading of file INF
- 2nd Attempt of remote loading of the specific file MAC if he is
- (Remote loading of the files Deck for MGCP)

6. The phone is connected to the service of the operator.

Some precise details:

If phone doesn't search INF from USB disk, you need to check up that usb icon display on LCD→USB is activated

The file "Common_config" will be downloaded only if the file's name has been change compared to the last upgrade.

The specific file MAC is downloaded (if there exists) if his parameter "config_sn" was incremented.

It is imperatively necessary to download the file TelConf before returning it to the customer.

Part 8 Ringtones configuration

1. Description

The ringtones which are integrated into the TB30 use a RTTTL format. A ringing with RTTTL format looks like the following example:

```
Halloween:d=4,o=5,b=180:8d6,8g,8g,8d6,8g,8g,8d6,8g,8d#6,8g,8d6,8g,8g,8d6,8g,8g,8d6,8g,8d#6,8g,8c#6,8f#,8f#,8c#6,8f#,8f#,8c#6,8f#,8d6,8f#,8c#6,8f#,8f#,8c#6,8f#,8f#,8c#6,8f#,8d6,8f#
```

These ringtones can be created by the user and they can be also downloaded for free on Internet.

We give a series of specialized websites where you can find example of tones:

- didier.elo.free.fr/ringtones.html
- www.xgsmonline.com/smartsmslogos.shtml
- www.kortable.com/sonneries/sonneries-nokia-rtttl.asp

2. Make a melody

There is the software *Ringtone Converter* which is free and simple of use that we advise you.

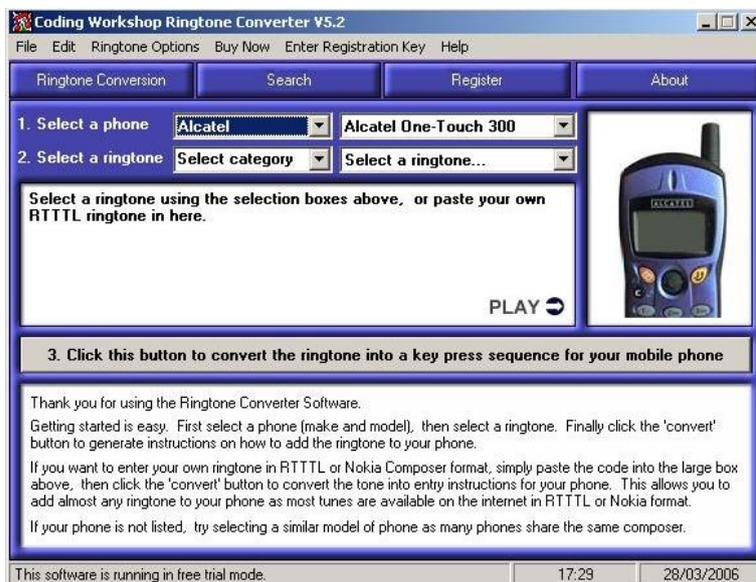

Figure 6 Ringtone Converter

You can download this software here:

www.codingworkshop.com/ringtones/

This software makes it possible to the user to create their own melodies directly with RTTTL format. For that, it is necessary to go in "File", "Ringtone composer" and finally "open with new melody"

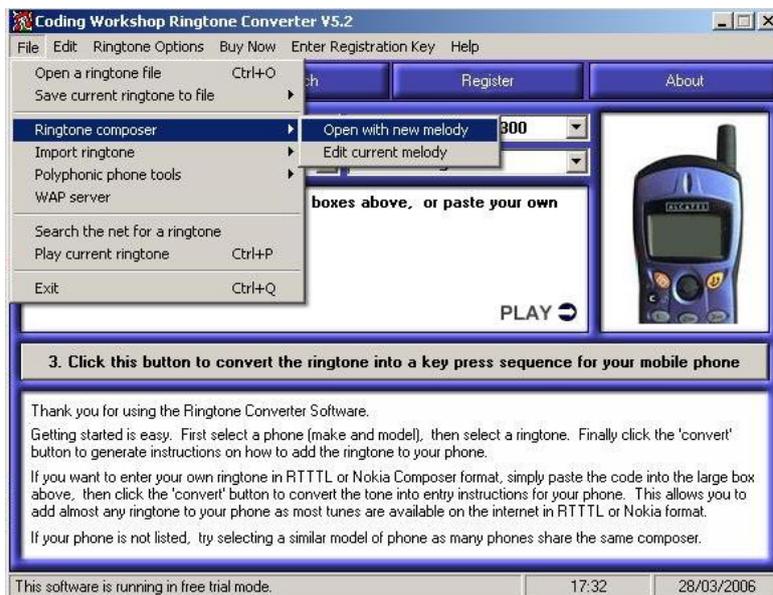

Figure 7 Ringtone Converter

The following screen is displayed and will make it possible to the user to compose the melodies according to its choice.

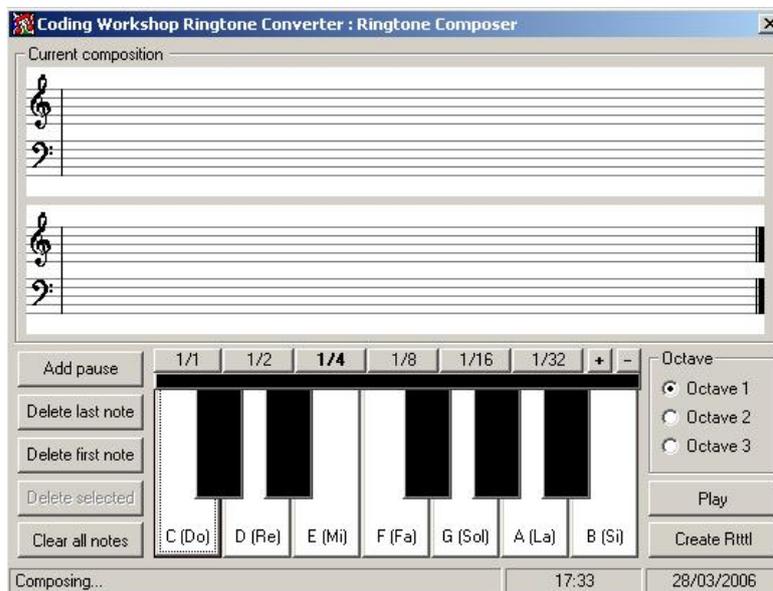

Figure 8 Ringtone Composer

Moreover, a data base, already comprising a great number of melodies to RTTTL format, is integrated into this software. To reach these rings, it is necessary to carry out the handling which is presented to you on the screenshot below.

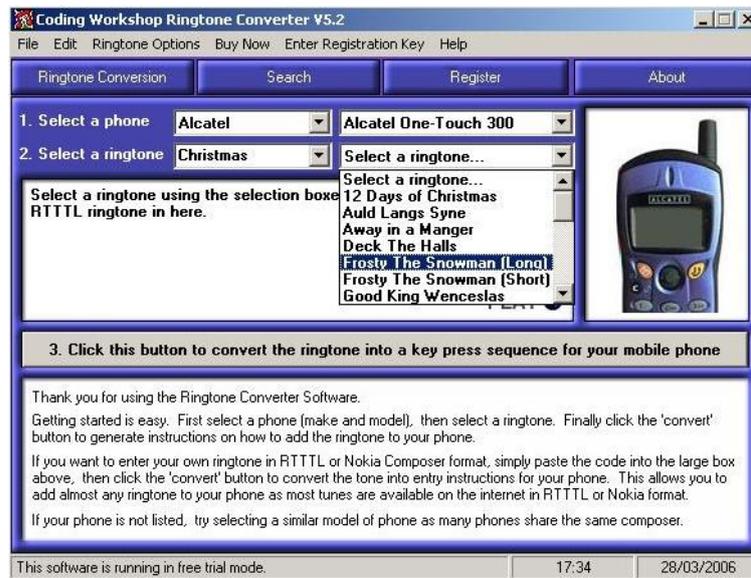

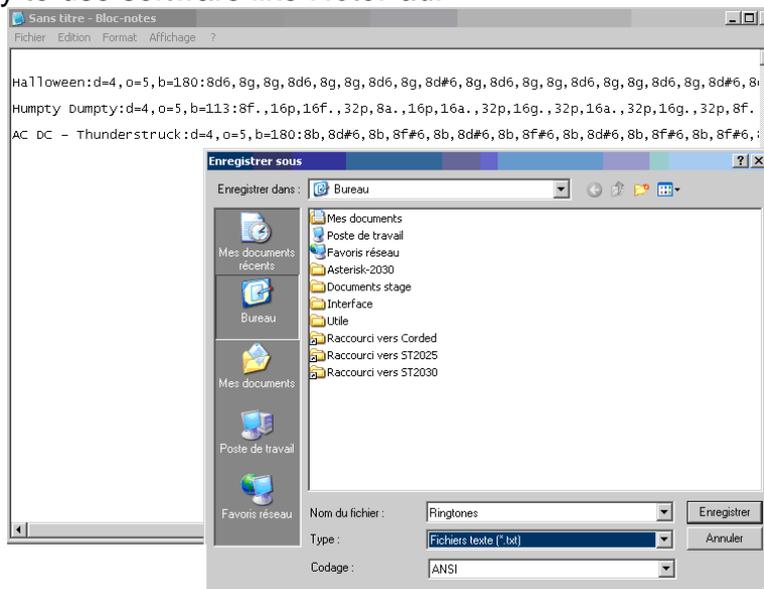

Figure 9 Ringtone Composer

3. Integration of the rings with TB30

In order to be able to integrate new ringtones, with RTTTL format, in his phone, the user must start by recopying all these rings with RTTTL format in a file with a txt extension. It is thus necessary to use software like *NotePad*.

Next we need to find the phone IP address. So:

If MGCP phone:

- Press on the key menu of the phone
- Press on the softkey admin
- Press on the button OK of the phone
- Select Network configuration while going down with the arrows
- Select IP address and note the address indicated

If SIP phone:

- Press on the key menu of the phone
- descend the cursor using the low button until Information
- Select Information and note the IP address indicated

IP address, that we recovered, must have returned in an Internet navigator (Mozilla, Internet explorer, etc.) in the following way: [adresseIPduTelephone/admin.html](#)

Next, we must click on « Advanced »:

Lastly, it is necessary to select "Melody management" and to enter the name of the file (txt extension) which contains the rings while clicking on browser.

Part 9 Backlight saving mode

1. Description

In order to correspond to implement Directive 2005/32/EC of the European Parliament and of the Council with regard to eco-design requirements for standby and off mode electric power consumption of electrical and electronic household and office equipment (hereafter referred to as EuP Directive) for power saving, new power saving features has added into TB30 IP phone.

2. Enter in idle mode with backlight OFF in TB30

Step 1 : Power up TB30 IP phone, after required initialization procedure finished, phone number and name will show on LCD display with backlight on. In this time, TB30 IP phone is under active mode.

Step 2 : After 30 seconds, backlight is OFF and TB30 enters to idle mode for power saving. At this moment, **TB30 IP phone is entering idle mode and its power consumption will be under 2.00 W.**

Part 10 Feature Overview

This part is to show the number of new features implemented in each software new release, up to 1.72.

Note

This administrator guide is based on firmware v1.72, you can download the latest administrator guide on:

www.thomsonbroadbandpartner.com

Unauthenticated SRTP need to be configured (3440) – v1.72

INTRODUCTION

Presently:

- unencrypted_SRTCP: it works half way (thanks to your "set sec_prof 0 rtcp negotiate" command)
- unauthenticated_SRTP: not yet configurable

For these 2 parameters, we expect they could be configurable.

On the set (mandatory to integrate SIP set in our TLS solution):

-Yes:

- . proposed in offer made
- . expected in offer receive (if not received: reject offer)

- No:

- . not proposed in offer made
- . not expected in offer receive (if present: reject offer)

- Adaptive (not proposed / accepted):

- . not proposed in offer made
- . accept offers with or without the parameter

The updated command is as bellow:

```
set sec_prof <prof_id> rtp <off |on | negotiate> (off: unauthenticated, on: authenticated, negotiate - default)
```

Voice Mail Key is active all the time (3600) – v1.72

INTRODUCTION

The Voice mail dedicated key is working only when you have received an Notify for Message Waiting Indicator.

Requirement

It would be better to make the key active all the time if “Subscribe to MWI” is enabled. So you could call the voice mail even if you have no messages.

Voice Mail Key dial "Voice Mail Telephone Number" even no subscribe (4066)

Introduction

- Be able to access Voice Mail if no subscribe & no notification.

Requirement

Request:

- In some configuration there is no Voice Mail server & No Subscribe possible.
- In this case the Key Voice mail is useless:
 - No new message indication
 - No Access to the Voice Mail

Some voice mail server doesn't provide the MWI & no Subscribe.

It would be nice that as soon as the field "Voice Mail Telephone Number" is filled in, you should be able to dial to that number with the MWI key.

In this case the Voice mail is like a direct memory Key.

Solution:

If Voice Number is fill. When user Press the Number the number associated is dial out.

Config File:

VoiceMailAddr=

VoiceMailTelNum=1234

VoiceMailPort=5060

If Voice Mail is press, Phone dial 1234.

Display Customer Icon in Standby (3959) – v1.72

INTRODUCTION

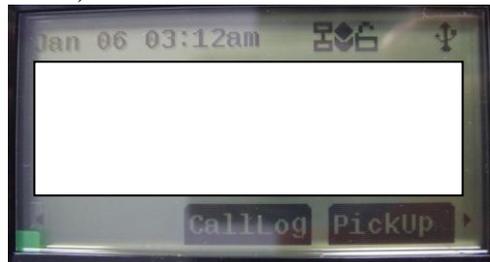

We have a customer that is requesting a new feature on TB30: Display on his Logo icon.

Requirement

- Standby (for SIP only):
 - o After a time out the Phone displays the Logo Icon.
 - o Default (empty)

Standby

In standby mode, the logo can be turn on or off. This logo displays in the middle 4 line of the screen (except 1st line and last line).

So it will not cover the softkey and some information. This logo can download by APS. It should support bitmap file format.

If there is a message (Missed call, CHP Supervision & SIP message) on the display, it should blink between the logo and the message.

A new parameter is added for APS.

app_logo_bmp=xxxx.bmp (B/W bitmap file only and the bitmap with inverted)

Icon Size = 240 x 80

To clean the icon:

app_logo_bmp= <empty>

The upgrade behavior is same as language table. It will include in XXX.inf file. Format as below:

XXX.inf with tftp

```
Tone_table=xxxx
Language_table=xxxx
app_logo_bmp=xxxx.bmp
```

xxx.inf with http

```
tone_table=http://path/filename
language_table=http://path/filename
```

app_logo_bmp= http://path/xxxx.bmp

Another new parameter is added for logo on/off. This parameter is configurable in common config file and telnet.

Config file: LogoDisplay = 0/1 (0: Off - Default, 1: On)

Telnet: lcdui set LogoDisplay 0/1

Remark: if there is no bitmap downloaded, even it is on; it will be the same as off.

Another new parameter is added for timeout for display logo. This parameter is configurable in common config file and telnet.

Config file: LogoTimeOut = 10 ~ 255s (30s default)

Telnet: lcdui set LogTimeOut 10 ~ 255

Reset to default single parameter (3864) – v1.72

INTRODUCTION

For the current implementation of APS mechanism, if the value is empty of some parameter, we don't change anything, for example, if you set "CWMPACSUser=" in ComConfTB30S_100204.txt, it will follow the setting you set before, so if you want to change this parameter for blank in this version, you must reset to default. So it is no way to set the parameter to empty.

As a result two keywords <default> and <empty> are defined.

CWMPACSUser=<default> will set to default value after APS.

CWMPACSUser=<empty> will set to empty value after APS.

Remark: <empty> is only apply for string parameter.

Phone Lock (3999) – v1.72

INTRODUCTION

- It is required to implement the possibility to lock the phone as required by our customer.
- When lock the phone:
 - Can't phone the user. (can't dial out, view call list, view phonebook etc.)
 - Emergency number can dial out in any case.
 - Can't go off-hook for Incoming call

Requirement

Instead of “Wrong Number”, the phone should display “Phone Locked”.

It must be able to dial the EmgDialPlan number even the phone is locked.

Some new parameters are added for this feature.

These parameters are configurable in common config file and telnet.

All these parameters are managed by Admin.

Admin make the choice of how the phone behave during phone lock.

Config file: `PhoneLockMode = 0/1 (0: display “Phone Locked” when dial - Default; 1: key locked.)`

Telnet: `lcdui set phonelockmode 0/1`

Config file: `AutoLockTimeout = 0 ~ 6000 second (0 - default)`

Telnet: `lcdui set AutoLockTmrout 0 ~ 6000`

`// 0: de-active auto lock`

`// 1 ~ 6000: means active auto lock. The minimum value is 30s. If it is setting at 1-30s, it will process as 30s. Phone will lock after xx (s).`

Use **OptionVisible = ...** the same way as auto answer, user can choose to display or not display in MMI with the setting in webpage Option Configure. And auto lock will be only used when **PhoneLockMode=1**

Config file: `IncomingLock = 0/1 (0: Incoming call is not lock – default; 1: Incoming call is lock.)`

Telnet: `lcdui set incomingLock`

Phone Lock Mode = 0

For PhoneLockMode = 0, it is same as the current implementation until software version x.72 but display “Phone Locked” when dial. AutoLockTimeout and IncomingLock are not work in this mode.

Phone Lock Mode = 1

Locking the phone

Press the “lock” soft key and change it to PhoneLock-On to key the Phone. When the phone is locked, “Unlock” soft key should be displayed and Lock icon is displayed.

Date	Hour	Icons
Name		
Phone		
Unlock		

PhoneLock

PhoneLock flag is used for enable/disable phone lock function. If the phone is locked, after power reset it must be still locked.

Key response

Any key is pressed except number key and “Unlock” soft key, it will display “Phone Locked” when phone is locked.

When number key is pressed, user goes off-hook, headset or handsfree key pressed, it will check for EmgDialPlan.

If it is not in the dial plan, it displays “Phone Locked”. Otherwise, it will let the phone to dial the number.

Date	Hour	Icons
Enter a Number		
Back		

During dialing the emergency number call log and phonebook function are not available. And if press callLog and Phbook softkey or Hardkey will be ignore. It can only dial out emergency number.

Date	Hour	Icons
01 XXXX		
Talking 00:00:XX		
hold	Tran	Conf
CallLog	PhBook	Endcal
	Newcal	

During Emergency if press Tran or conf or New Call only emergency call number can be dial out. If user dials a normal number, it displays “Phone Locked”.

Incoming call cannot be received in the case of dial out emergency number. The phone will not alert the user that is an incoming call. If the incoming call is finished before Emergency call, it stores the incoming call into the miss call list. Otherwise, when Emergency call is ended, the phone will ring.

Incoming Call

When IncomingLock = 0, the phone will ring for the incoming call and the phone lock function is temporary disable until it goes call end, on-hook or ring stop.

Date	Hour	Icons
Ringing...		
XXXX		
Back		

When IncomingLock = 1, the phone will ring but the user must press the unlock key to unlock the phone first before use the phone.

Date	Hour	Icons
Incoming Call Lock		
Unlock		

AutoLock

Use **OptionVisible** = ... the same way as auto answer, user can choose to display or not display in MMI with the setting in webpage Option Configure. And auto lock menu will be only appeared and used when **PhoneLockMode=1 & AutoLockTimeout != 0**.

Date	Hour	Icons
Config	Admin	Option

AutoLock = 0

Date	Hour	Icons
DoNotDisturb-OFF		
PhoneLock-OFF		
PhoneAutoLock-OFF		
Reboot		
Change		Back

AutoLock = 1

Date	Hour	Icons
DoNotDisturb-OFF		
PhoneLock-OFF		
PhoneAutoLock-ON		
Reboot		
Change		Back

AutoLock Timeout

If AutoLockTimeout != 0, it will go to phone lock mode after timeout when in idle mode. The timeout can be changed by AutoLockTimeout. AutoLockTimeout is fixed by Admin.

Example Setting

Display "Phone Locked" when dial

PhoneLockMode = 0

Key Lock without incoming call lock

PhoneLockMode = 1

IncomingLock = 0

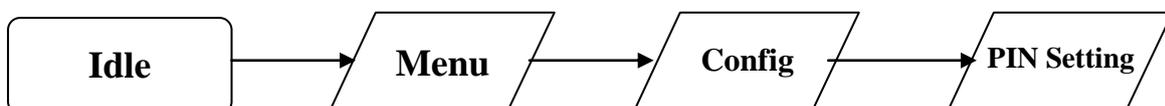

Key Lock with incoming call lock

PhoneLockMode = 1

IncomingLock = 1

Password Protection

Same as Current implementation

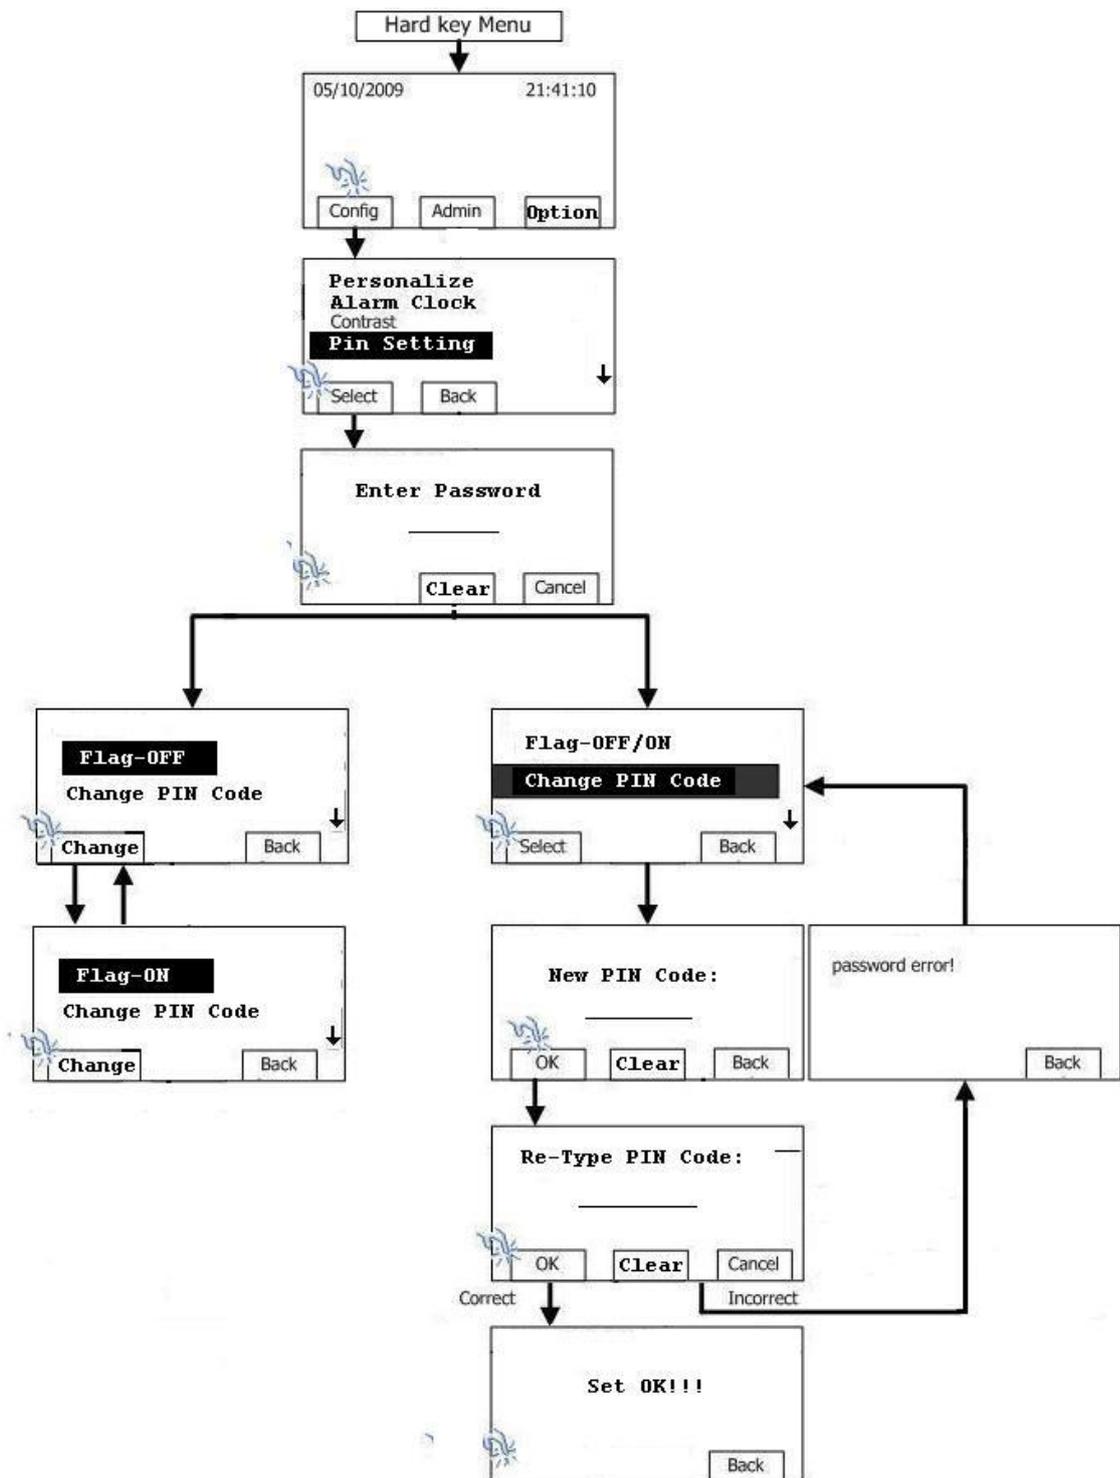

Date	Hour	Icons
Enter Password		

OK	Clear	Cancel

Date	Hour	Icons
Flag-OFF		
Change PIN Code		
Change		Back

Options list

No.	Option Message	Data Format	Comment
(3)	Flag	ON OFF	<ul style="list-style-type: none"> ◆ When Status is ON, the phone lock setting will be authorized by checking personal code. ◆ Press Change to enable/disable the item.
(4)	Change Code		<ul style="list-style-type: none"> ◆ Press soft key "Change" to change PSW ◆ The default password is 0000.

Locking phone with Password Protection

Pressing the “Lock” soft key

Date	Hour	Icons
Enter Password		

	Clear	Cancel

Date	Hour	Icons
PhoneLock-OFF		
Change		Back

Pressing “Change” soft key

Date	Hour	Icons
PhoneLock-ON		
Change	OK	Back

Press “OK” soft key to lock the phone.

Block Web GUI (4067) – v1.72

Introduction

- Suppress access to TB30 Web GUI for user & admin.

Requirement

Request: Block Web Gui access for Admin & User access.

Solution: Disable Webpage. Telnet, Tr69, SNMPS and APS need to work fine.

New parameters are added for this feature:

Config File: WebGuiBlocked= 0/1 (0: WebPage is accessible – default; 1: WebPage is Blocked)

Telnet: sys set web_blocked 0/1

When WebGUI is blocked. Configuraiton is done by telnet, APS and Tr69. In order to unblock WebGUI, you can do it by APS or Telnet.

Display Customer Icon on Web (4096) – v1.72

Introduction

- Implement change of the Web Gui Icon to Customer icon.

Requirement

Request: Change the WebGui Default Icon to Customer Icon

Solution: Introduce a new parameter in config file to allow customer to change the icon.

Default Icon: Thomson (logo_THOMSON_smal_2.bmp)

THOMSON

logo_THOMSON_smal_2.zip

Size of the Icon: 180*60 Max.(Thomson is 169*58)

Format of the Icon: .bmp

Parameter Add in .inf: **Web_logo_bmp=xxxx.bmp**

The upgrade behavior is same as language table. It will include in XXX.inf file. Format as below:

XXX.inf with tftp	xxx.inf with http
Tone_table=xxxx Language_table=xxxx Web_logo_bmp=xxxx.bmp	tone_table=http://path/filename language_table=http://path/filename Web_logo_bmp= http://path/xxxx.bmp

Parameter is added for logo on/off.

This parameter is configurable in common config file and telnet, Tr69.

Config file: WebLogoDisplay = 0/1

Telnet: sys set WebLogoDisplay 0/1

(0: off - Display Default “Thomson” Icon; 1: on - Display Web_logo_bmp)

Remark: if there is no bitmap downloaded, even it is ON, it will be display default “Thomson” icon.

USB Login/logout (3995) v1.72

INTRODUCTION

The idea is to use USB for Login/Logout so that we can work for Open Office with FreeSeating. User has a single USB with Name & Phone number & one configuration.

If the user plugs the USB into TB30, it will login automatically. If the user unplugs the USB drive from TB30, it will logout automatically.

Requirement

Same as the current manual login/logout, we need to enable the manual_log configuration.

Config file: ManualLog = 1

Telnet: sys set manual_log 1

A new parameter is added for USB logon/out. This parameter is configurable in common config file and telnet.

Config file: logINlogOUTmode = 0/1

Telnet: sys set LoginLogoutMode 0/1

(0: current login/logout behavior; 1: usb login/logout behavior)

Also in web, there is a check box to enable/disable this feature.

When the USB drive (FAT32 format only) is plug into TB30, it will check for the login/logout config file (TB30LogINLogOUT.txt or TB30LogINLogOUT.ser. If both files exist, only TB30LogINLogOUT.ser will use). If a config file is in the USB key, it will read the config file and setup the phone automatically. When the USB drive is unplug, it will restore the original setting. The config file format is:

UserID /PWD/PhoneName/PhoneNum/PinCode
e.g. RegID/RegPwd/Hong/1000/0000

If the Pin is not empty, it prompts the user for a PIN code when you insert the USB key. If the PIN code is correct apply the dynamic profile, else stay with default profile (in reference of login/logout spec).

Encryption/Decryption tools:

- Name: Window_Aes_cbc_128.exe (including in release package/ Decryption tool folder)
- Press F1 for get HELP window

Decryption key

Config file: Log_Decryption_Key = Th0mson2\$8s8@9z! (default)

Telnet: sys set LoginDecKey Th0mson2\$8s8@9z!

	USBlogINlogOUT = 0	USBlogINlogOUT = 1
USB Drive plug into TB30	No Action	USB Login
USB Drive remove from TB30	No Action	USB Logout

Call Log Prefix

You can set Call Log Prefix in Web GUI – advance -> Call feature -> Call Log Prefix. Then call from call log, the prefix number will be carried before dialed number.

Venezuela Numbering Plan

Feature Activation

```
Check_phonebook_domain_name=0
V_flag=1
V_state_prefix=212 (for example)
```

Via APS

APS in [sys] section of both Common and Specific-MAC config files with the new parameter – V_flag, V_state_prefix.

V_flag = 0/1, // 0: Disable Venezuela Numbering Plan (default)
 // 1: Enable Venezuela Numbering Plan

V_state_prefix = (empty for default), prefix

```
[ipp]
...
Check_phonebook_domain_name=0
...

[sys]
...
V_flag=1
V_state_prefix=212
...
```

Via Telnet

To configure, open a command line console, and telnet the phone:

Example:

V_flag is set to enable (**sys set V_flag 1**)

```
[administrator]# sys set V_flag 1
[OK] Set OK

[administrator]#
```

V_state_prefix is set to 212 (**sys set V_state_prefix 212**)

```
[administrator]# sys set V__state_prefix 212
[OK] Set OK

[administrator]#
```

Check_phonebook_domain_name is set to disable (**ipp set Check_phonebook_domain_name 1**)

```
[administrator]# ipp set Check_phonebook_domain_name 0
[OK] Set OK

[administrator]#
```

Then type **commit** and then **activate** to apply the change.

After setting,

Example 1-Received p-asserted-id (user part of sip uri): 582125671234

Number to be displayed for the incoming call: 5671234

Number to be stored in call log: 5671234

Matches with phonebook number entry: 5671234

Example 2- Received p-asserted-id (user part of sip uri): +582461234567

Number to be displayed: 02461234567

Number to be stored in call log: 02461234567

Matches with phonebook number entry: 02461234567

Example 3- Received p-asserted-id (user part of sip uri): +584147654321

Number to be displayed: 04147654321

Number to be stored in call log: 04147654321

Matches with phonebook number entry: 04147654321

LLDP

The following parameters are added for LLDP Service. This parameter is configurable in common config file and telnet.

```
lldpXFlag = 0/1           // 0: Disable LLDP function (Default)
                        // 1: Enable LLDP function
```

```
lldpTxPeriod = 5 - 32768 (30 default)
lldpTTL=120
lldpPortDesc=
lldpSysName=
lldpSysDesc=
lldpSysCap=2097184
lldpChassisID=4
lldpPortID=4
lldpXMediaCap=65539
lldpXNetPolicy=1
lldpXEndpLocIdenti=0
lldpXAssetID=
```

Feature Activation

Via APS

APS in [net] section of both Common and Specific-MAC config files with all LLDP parameters.

```
[net]
...
lldpXFlag=0
lldpTxPeriod=30
lldpTTL=120
lldpPortDesc=
lldpSysName=
lldpSysDesc=
lldpSysCap=2097184
lldpChassisID=4
lldpPortID=4
lldpXMediaCap=65539
lldpXNetPolicy=1
lldpXEndpLocIdenti=0
lldpXAssetID=...
...
```

Via Telnet

To configure, open a command line console, and telnet the phone:

Example:

lldpXFlag is set to enable (**lldp set lldpXFlag 1**)

```
[administrator]# lldp set lldpXFlag 1
[OK] Set OK

[administrator]#
```

Then type **commit** and then **activate** to apply the change.

Cirpack MGC & Hua Wei SoftSwitch

TB30 have implement Softswitch (Hua Wei SoftX3000 V300R006) PSTN call handling including call waiting and switching. It is also support Cirpack MGC service

A parameter is used to set Hua Wei SoftSwitch & Cirpack MGC Service. This parameter is configurable in common config file and telnet.

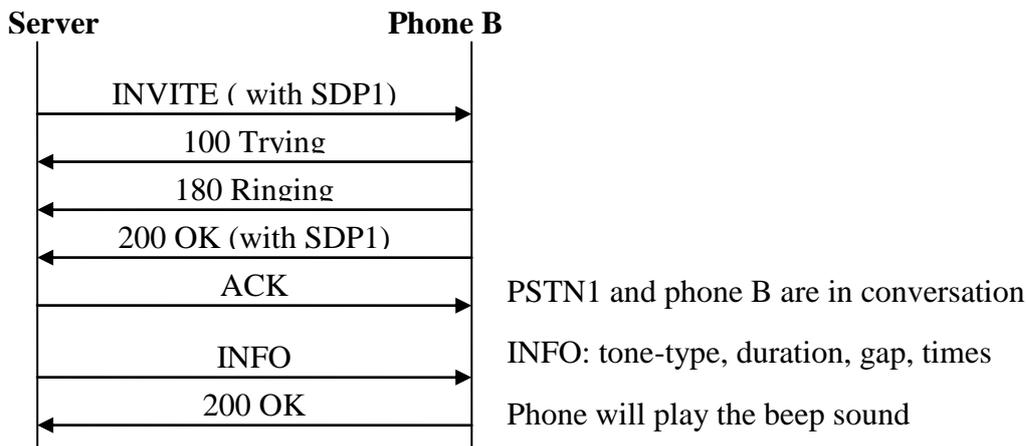

For the flag for this feature

```
MGC_service = 0/1/2           // 0: disable (default)
                               // 1: HW_pstn
                               // 2: Cirpack MGC service
```

Hua Wei SoftSwitch (MGC_service = 1)

Flow descriptions:

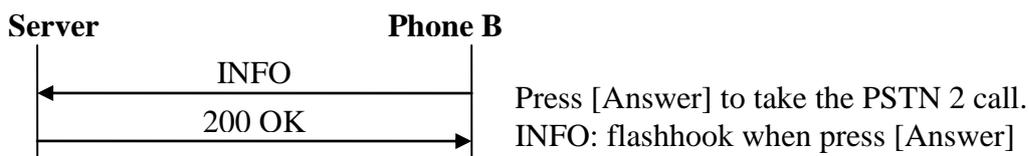

Below is to list out a flow which shows PSTN 1 call to IP phone B in conversation, then PSTN 2 call to IP phone B.

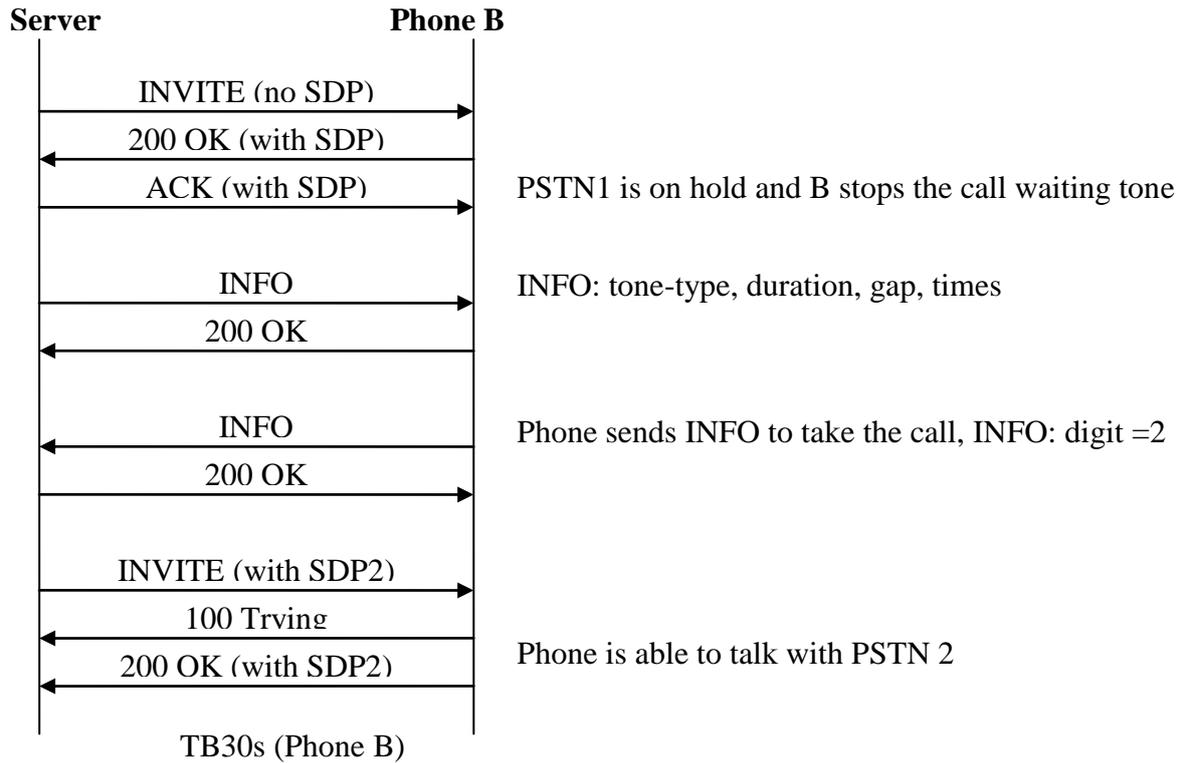

[Answer] and [Reject] softkey displays on the screen.

TB30s (Phone B)

Date	Hour	Icons
01 PSTN Call		
Answer	Reject	

Remark: Go back to previous screen when [Reject] is pressed.

Date	Hour	Icons
01 PSTN Call/phone number		
Taking	Duration	
Hold	Switch	Conf

Remark: Pressing [**Hold**], [**Conf**] and [**Transfer**] will keep the same as current implementation.

Switch implementation

Requirement

- [Switch] softkey is required to caller parties to switch between caller during conversation

Below is to list out a flow which shows IP Phone B call to IP phone A in conversation, then PSTN 1 call to IP phone B. B and PSTN 1 are in conversation. Phone B presses [Switch] back to phone A and start conversation.

Flow descriptions:

Phone A ↔ Phone B, operate in normal SIP protocol

PSTN 1 → phone B, call waiting tone is played, same as the call waiting flow above → call activated

Phone B presses [Switch] to talk back with phone A

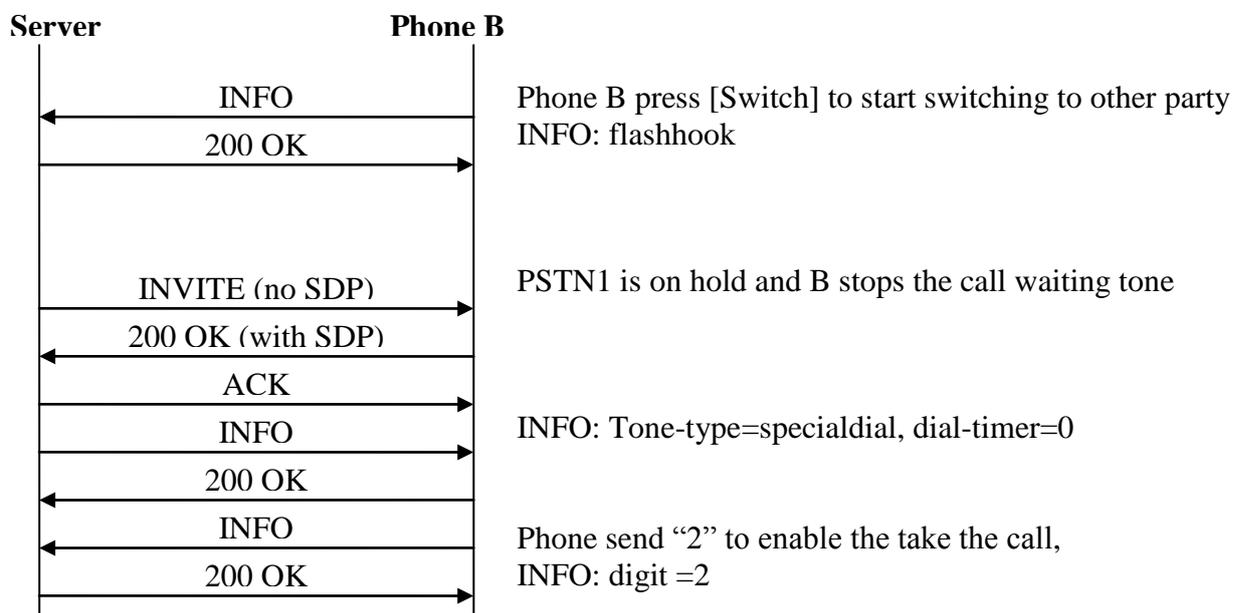

(PSTN 1 and Phone B are in conversation)

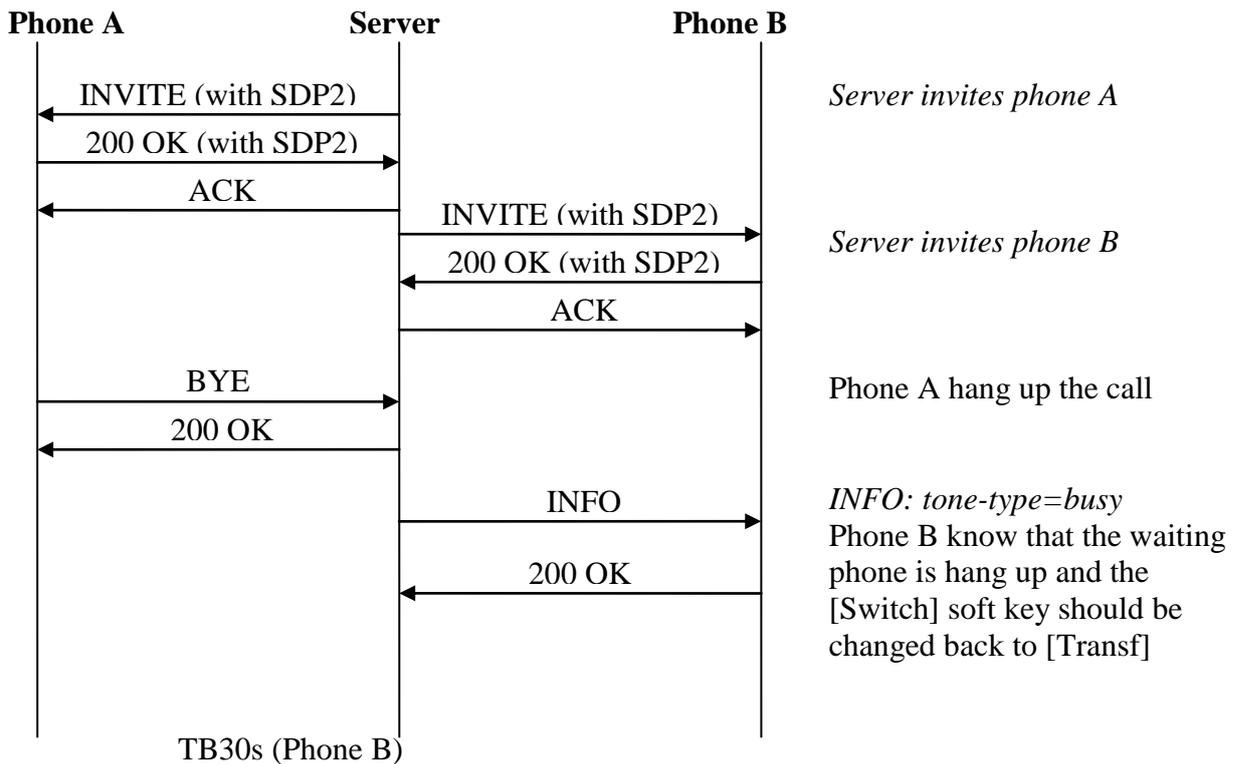

TB30s (Phone B)

Date	Hour	Icons
01	PSTN Call/phone number	
Taking	Duration	
Hold	Switch	Conf

Transf >

When [Switch] is pressed, switching is processed.

Date	Hour	Icons
01 PSTN Call/phone number		
Taking	Duration	
Hold	Transf	Conf

Cirpack MGC service (MGC_service = 2)

The following parameters are added for Cirpack MGC service/
 Dial_Dtmf_Code = '#5' (default)
 Alternate_Dtmf_Code = '#2' (default)
 Rel_Libretre_Dtmf_Code = '#0' (default)
 Ans_Libretre_Dtmf_Code = '#1' (default)
 Transfer_Dtmf_Code = '#4' (default)
 Conference_Dtmf_Code = '#3' (default)

Feature Activation

Via APS

APS in [sys] section of both Common and Specific-MAC config files with all MGC parameter.

MGC_service = 0 disable (default)

```
[sys]
...
MGC_service=0                // Disable (default)
...
```

MGC_service = 1 Hua Wei Softswitch PSTN handling

```
[sys]
...
MGC_service=1                // Hua Wei Softswitch
...
```

MGC_service = 2 MGC Cirpack Service

```
[sys]
...
MGC_service=2
Dial_Dtmf_Code=#5
Alternate_Dtmf_Code=#2
Rel_Libretre_Dtmf_Code=#0
Ans_Libretre_Dtmf_Code=#1
Transfer_Dtmf_Code=#4
Conference_Dtmf_Code=#3
...
```

Via Telnet

To configure, open a command line console, and telnet the phone:

Example:

1. MGC_service is set to disable (**sys set mgc_service 0**)

```
[administrator]# sys set mgc_service 0
[OK] Set OK

[administrator]#
```

2. MGC_service is set to Hua Wei Softswitch PSTN handling (**sys set mgc_service 1**)

```
[administrator]# sys set mgc_service 1
[OK] Set OK

[administrator]#
```

3. MGC_service is set to Cirpack MGC Service (**sys set mgc_service 2**)

```
[administrator]# sys set mgc_service 2
[OK] Set OK

[administrator]#
```

Then type **commit** and then **activate** to apply the change.

BLF

The objective of this section is to present the way TB30 SIP uses backlit function keys to monitor the state of other extensions. The backlit function keys will indicate if an extension is idle, in use, or ringing. This feature is known as BLF or Monitoring Extension function.

TB30 extension module can be used to have more programmable keys on board. There are basically two scenarios:

- **Server-to-phone scenarios:** there is a SIP proxy which controls the state of each extension and sends the appropriate messages to the supervisor phone. Asterisk is an example and the reference followed for implementation.
- **Phone-to-phone scenarios:** each phone is responsible for notifying its own state to supervisor phones

TB30 supports three types of BLF – two types of BLF based on “dialog” event package: User and List-oriented, third BLF: Presence based BLF. Please note default mode for BLF is User-Based.

User-oriented BLF

Mechanism used for BLF is SUBSCRIBE/NOTIFY messages described in RFC-3265.

The device will subscribe to the state of the extension of interest and receive status notifications from this extension or from the proxy in order to drive the LEDs.

High level technical description

When the phone is initialized, it will send out a SUBSCRIBE message to the proxy for each extension it would like to monitor. This is to subscribe to the state of the other extension. The proxy (and in some cases the other extension) needs to support these subscriptions. At this point 2 things can happen depending on the Proxy, which correspond to the scenarios listed above:

- **Phone-to-phone scenarios** : the proxy will forward the SUBSCRIBE to the far phone. Then the phone needs to log all extensions which subscribed, and send out NOTIFY messages when changes happens in its state.

- **Server-to-phone scenarios** : the proxy captures the SUBSCRIBE, does not forward it and sends state changes as the body of a NOTIFY on behalf of the phone. Asterisk Server does this.

The "<state>[early](#)|[confirmed](#)|[void](#)</state>" in the received NOTIFY msgs determines the LEDs activity.

- If the line on the extension rings, the programmable key LED on the phone blinks. Related state is [early](#).
- If the line on the extension is busy, the programmable key LED on the phone is steadily lit. Related state is [confirmed](#).
- If the programmable key LED on the phone is off, then the programmable key can act as a speed dial key for the same supervised destination number. Related state is [void](#) (state not provided), or [terminated](#).

Other tags could be supported in future releases.

User interaction

In idle mode

Pressing a key whose LED is **off** (phone in **idle** mode, state [void](#)) performs a call to the corresponding phone.

Pressing a key whose LED is **on** (phone **busy**, state [confirmed](#)) performs a call to the corresponding phone, a normal call.

Pressing a key whose LED is **blinking** (**phone ringing**, state [early](#)) performs a call pickup of the corresponding phone.

During a call or conference

Same behaviour as in idle mode except it is in a second call (or third...). This would be equivalent to the user pressing the softkey "New Call" and placed a call to that extension.

BLF Configuration

Web GUI

The setup of the function keys can be done using the TB30 web interface. First, if you are going to use any of the function keys in the phone instead of an extension module, you need to reconfigure the max number of lines in **Advanced** → **Advanced**. In this example it has been set to 5, which leaves room for 5 supervision lines:

To configure the function keys, visit **Advanced** → **Call features** and click on

Function keys:

The feature keys are split in 3 pages:

F1 to F10

F11 to F38 (1st extension module, will only appear if the module is detected)

F39 to F66 (2nd extension module, will only appear if the module is detected)

On each page, the feature keys are detailed in a list.

For each line the administrator is able to setup:

- The line type:
 - Line (normal speedial)
 - or
 - Supervised Line (Supervised behavior described above)
- The corresponding extension

3.2 Provisioning files (APS)

Feature keys are configurable using configuration files, either common or MAC specific, and syntax is the same for both. These parameters, as can be checked in TB30S_Config file syntax document and sample files, will be included in [sys] section.

The parameters will follow this pattern:

FeatureKeyExtXX=Y/<sip:2006@10.0.0.5>

With: 01 <= XX <= 66

With: Y = [L:S]

L= Line (no supervision)

S= Supervised Line

Ex:

```

List-oriented BLF

The purpose of this feature is to supervise other phones as is the case of standard BLF (from now on, referred to as User-Based BLF). This feature is tailored to Broadworks environments.

The main difference from administrator point of view is the dynamic provisioning via NOTIFY of all the supervised parties contained in an URI-List-versus static provisioning for User-Based BLF

To benefit from them, some changes have been done due to improvements in Broadsoft implementation (R14).

LED state:

If [in a monitoring NOTIFY] for the same <resource uri> you get several <state> tags (different dialogs):

- LED blinking - if any of the state tags for that resource uri is "Proceeding" and direction=recipient, a global Proceeding state will be signaled

```

<?xml version="1.0" encoding="UTF-8"?><dialog-info
xmlns="urn:ietf:params:xml:ns:dialog-info" version="6" state="full"
entity="thomson2@as.iop1.broadworks.net"><dialog id="bG9jYWxIb3N0NDU5NDY5OjA="
direction="recipient"><state>proceeding</state>
<local><identity display="Broadsoft
SIP2">sip:thomson2@as.iop1.broadworks.net</identity><identity display="Broadsoft
SIP2">tel:+12408881412;ext=1412</identity></local>
<remote><identity display="BroadSoft

```

```
SIP4">sip:1414@as.iop1.broadworks.net;user=phone</identity></remote>
</dialog></dialog-info>
```

- LED steady lit - if no Proceeding (direction=recipient) tags are present, and any of the state tags for that resource uri is Proceeding with direction = originator or any of the state tags is Confirmed

```
<?xml version="1.0" encoding="UTF-8"?><dialog-info
xmlns="urn:ietf:params:xml:ns:dialog-info" version="11" state="full"
entity="thomson4@as.iop1.broadworks.net"><dialog id="bG9jYWxIb3N0NDU5NDY4OjA="
direction="initiator"><state>confirmed</state>
<local><identity display="BroadSoft
SIP4">sip:thomson4@as.iop1.broadworks.net</identity><identity display="BroadSoft

<remote><identity display="Broadsoft
SIP1">sip:1411@as.iop1.broadworks.net;user=phone</identity></remote>
</dialog></dialog-info>
```

- LED off - if all the state tags are Terminated

```
<?xml version="1.0" encoding="UTF-8"?><dialog-info
xmlns="urn:ietf:params:xml:ns:dialog-info" version="7" state="full"
entity="thomson2@as.iop1.broadworks.net"><dialog id="bG9jYWxIb3N0NDU5NDY5OjA="
direction="recipient"><state>terminated</state>

<local><identity display="Broadsoft
SIP2">sip:thomson2@as.iop1.broadworks.net</identity><identity display="Broadsoft
SIP2">tel:+12408881412;ext=1412</identity></local>
</dialog></dialog-info>
```

User action

There are three different statuses defined when the BLF Key is pressed:

1. LED in idle - it causes speed dial provisioned number
2. LED steady on – it causes speed dial provisioned number
3. LED blinking –it causes launch call pickup (See below 3.3)

Call pickup (directed pickup)

The method to launch pickup will depend on the local/sc configuration flag.

The number used to launch pickup when BLF key is pressed in led blinking state will be taken from the dialog-info section of the received NOTIFY.

The starcode used for pickup will be in accordance with your server configuration.

Feature Activation

A) Through WebGui:

In order to have List-oriented BLF active, APS or web gui can be used.

First you have to decrease Multiline (or use an extension module) to reserve the number of supervised lines in Function Key, in Advanced → Advanced.

Then go to Advanced → Call feature. Parameter “Start Spare Fk” indicates the first function key which will be dynamically provisioned.

This parameter, by default, is automatically set to Multiline+1. If you want to keep some keys reserved for speedial, please change this value

Select “List-oriented BLF”, and configure the List-uri to which the phone should subscribe, in accordance with your server configuration

Then, you can check the configuration through Advanced → Call feature → Function Key table.

To enable the call pickup feature from function key BLF, please enter the starcode defined in your server.

B) Through APS:

The parameters governing this feature, both included in the [sys] section, are:

BLFType

Value : 0, 1 or 2

0 : User-oriented BLF is active

1 : List-oriented BLF is active

2 : Presence based BLF is active

Default value: 0

BLFListSipUri

Value: L/<sip:user@host>

Meaning: contains the URI of the List the phone will need to subscribe in order to monitor users. This URI has to be provided by your sip server administrator.

StartSpareFK

Value : numeric, from Current_Max_Multiline+1 to the number of function keys available

Meaning : n : Fn will be the first position to be automatically filled in via List-oriented BLF dynamic provisioning.

Default value: Current_Max_Multiline+1

Current_Max_Multiline

Value: 1 to 10

Meaning: number of simultaneous calls the phone will handle. BLF is not possible with keys assigned to multiline, that is why this parameter needs to

be adjusted in order to use BLF. If you intend to use an extension module for BLF, then you need not change this parameter.

```
[sys]
BLFType=1
BLFListSipUri=L/<sip:List-URI@thomson.net>
Current_Max_Multiline=4
StartSpareFK=6
....
```

With these parameters, List-oriented BLF is enabled, the List Uri is List-URI@thomson.net and the first key to be provisioned is F6

Presence based BLF

For some other environments, it is desirable to support also a third flavour, based this time on a different subscribe/notify package: presence.

Function keys will be used for this purpose. Limitation will be the same as for the other types of BLF: if phone is configured for multilines = m, then m+1 is the first function key to be used for BLF.

Presence information is provided by the server to subscribers for presentity. TB30 does not need to provide information about itself, neither will receive a subscription to declare its presence status. TB30 will hence act only as a supervisor.

Once TB30 has subscribed to presentity, the server will notify changes in supervised party status by sending NOTIFY with application/cpim-pidf+xml content.

In order to supervise a certain sip uri, TB30 will need to send a SUBSCRIBE towards the SIP proxy, with

```
From: supervisor
To: supervised party uri
Event: presence
Accept: application/cpim-pidf+xml
```

A NOTIFY will be received whose body will include the state of the different entities declaring presence for that uri.

No new parameters needed.

New values:

BLF type: add new value to existing parameter.

Reused values:

For FeatureKeyExtxx, S/<sip:> will be used

For FeatureOptKeyxx, its value should be ignored when BLFType for Presence BLF is selected.

Parameter name	Description	Values	Default value	CLI commands
BLFType	Type of BLF that is active	0: User-Oriented BLF is active 1: List-oriented BLF is active 2: Presence based BLF is active	0	sys set blf_type [0(User-oriented BLF), 1(List-oriented BLF), 2(Presence-based BLF)]
FeatureKeyExt01 .. FeatureKeyExt66	Configure feature key as line key or supervision key for monitor extension	L: Line Key S: Supervision Key G: Sylantr Group Pickup R: Sylantr last number recall B: Sylantr BLA extension E: Extension Tekelec D: DTMF V: Service U: Service Supervision A: Broadsoft SCA M: multi-Registration	L/<sip:>	sys show fk 1 .. sys show fk 6

Feature Activation

Via APS

APS in [sys] section of both Common and Specific-MAC config files with BLFType parameter.

```
[sys]
...
BLFType=2
...
```

Via Telnet

To configure, open a command line console, and telnet the phone:

Example:

BLFType is set to Presence Based BLF (**sys set blf_type 2**)

```
[administrator]# sys set blf_type 2
[OK] Set OK

[administrator]#
```

Then type **commit** and then **activate** to apply the change.

ACR response

When incoming call for TB30 is Anonymous and phone has ACR enabled, TB30 sends as response message 603 – Declined but some server require phone should send message 433 - Anonymity Disallowed.

Feature Activation

Via APS

APS in [sip] section of both Common and Specific-MAC config files with the new parameter – **ACRResp**.

ACRResp = 0 403 Forbidden

ACRResp = 1 433 Anonymity Disallowed

ACRResp = 2 603 Declined

```
[sip]
...
ACRResp=1
...
```

Via Telnet

To configure, open a command line console, and telnet the phone:

Example:

ACRResp is set to 433 (**sip set acr_resp 1**)

```
[administrator]# sip set acr_resp 1
[OK] Set OK

[administrator]#
```

Then type **commit** and then **activate** to apply the change.

Attend Transfer

There is a hold action before sending REFER message with current behavior of attend transfer. However, the transfer behavior will be processed by some server. That's why some server will have the problem of attend transfer. Our solution is to not sending the hold before REFER message. So it should have a flag to this feature to keep the former behavior and also meet this server requirement.

Feature Activation

Via APS

APS in [sip] section of both Common and Specific-MAC config files with the new parameter – **Hold_bf_Att_Trans**.

Hold_bf_Att_Trans = 0 with hold behavior in attend transfer

Hold_bf_Att_Trans = 1 without hold behavior in attend transfer

```
[sip]
...
Hold_bf_Att_Trans =0
...
```

Via Telnet

To configure, open a command line console, and telnet the phone:

Example:

Hold_bf_attrans is set to 1 (**sip set hold_bf_attrans 1**)

```
[administrator]# sip set hold_bf_attrans 1
[OK] Set OK

[administrator]#
```

Then type **commit** and then **activate** to apply the change.

Preferred Identity

For some server when TB30 is sending in INVITE header parameter P-Asserted-Identity (which is not assigned for CPE but for network) so phone should not use it. Instead of Phone should correctly send parameter P-Preferred-Identity.

A new parameter is added for INVITE header parameter. This parameter is configurable in common config file and telnet.

P_id_type = 0/1 (default 0:P-Asserted-Identity)

```
// 0: P-Asserted-Identity
// 1: P-Preferred-Identity
```

Feature Activation

Via APS

APS in [sip] section of both Common and Specific-MAC config files with the new parameter – **P_id_type**.

```
[sip]
...
P_id_type=1
...
```

Via Telnet

To configure, open a command line console, and telnet the phone:

Example:

P_id_type is set to P_Rpreferred_Identity (**sip set P_id_type 1**)

```
[administrator]# sip set P_id_type 1
[OK] Set OK

[administrator]#
```

Then type **commit** and then **activate** to apply the change.

DSCP of DHCP

In this release, you can change DSCP of DHCP separately.

Feature Activation

Via Web GUI

1. Login to TB30 Web GUI
2. Go to Advanced Page
3. Choose QoS
4. In Diffserv, choose Voice
5. In DS Code Point for DHCP, change the value you want.
6. Press Apply and restart the phone.

Via APS

APS in [qos] section of both Common and Specific-MAC config files with the new parameter – **DSCP3**.

DSCP3 = 0 ~ 63

```
[net]
...
DSCPflag=1
...
[qos]
...
DSCP3=0
...
```

Via Telnet

To configure, open a command line console, and telnet the phone:

Example:

```
[administrator]# net set dscp 1
[OK] Set OK

[administrator]# qos set dscp 3 0
[OK] Set OK
```

Then type **commit** and then **activate** to apply the change.

Input mode

In the release package, it is possible to change the input mode and char set used.

1. LangTbl_x.69.2.zz (original English Language Table).
2. LangTbl_x.69.2_Czech.zz (sample Czech Language Table – Still in English but with Czech input mode).

By editing the Language Table, we can have Czech Display and Edit mode.

1. Edit language table by text editor
2. Change the line for Country name. E.g. <Country>Czech</Country>
3. Change the line for Character Set. E.g. <Charset>Latin-2</Charset>
4. Change the EditModeInputKey. E.g.

```
<EditModeInputKey>
<Key0>0 @%()[\&lt;&gt;&lt;&gt;</Key0>
<Key1>1.,=+-&lt;&gt;^</Key1>
<Key2L>abc2 á č</Key2L>
<Key2U>ABC2 Á Ć </Key2U>
<Key3L>def3ď é ě</Key3L>
<Key3U>DEF3Ď Ě Ě </Key3U>
<Key4L>ghi4í</Key4L>
<Key4U>GHI4Í</Key4U>
<Key5L>jkl5ľ</Key5L>
<Key5U>JKL5Ľ</Key5U>
<Key6L>mno6ň ó</Key6L>
<Key6U>MNO6Ň Ó</Key6U>
<Key7L>pqr7 ř š</Key7L>
<Key7U>PQRS7Ř Š</Key7U>
<Key8L>tuv8 ť ú û</Key8L>
<Key8U>TUV8Ť Ú Ű</Key8U>
<Key9L>wxyz9 ž ý</Key9L>
<Key9U>WXYZ9 Ž Ý</Key9U>
<KeyStar>*#!:;'"_</KeyStar>
<KeyPound>#</KeyPound>
</EditModeInputKey>
```

Remark: if your text editor (OS) is not Latin-2, after saving the file, you will lose your input. If it is the case, you need to edit by Hex Editor. For example, you can download a freeware HEX editor by:

<http://www.chmaas.handshake.de/delphi/freeware/xvi32/xvi32.htm>

5. Using the APS to download Language table.
6. Choose the language to this Language table.

Config without reload

Starting from this version changing config/setting in SIP Signalling, Option Configure, Call feature and Advanced Web page, TB30 do not need to reboot.

Except “RTP Starting Port Number” and “Minimum Session Timer”, all parameter changed in SIP Signalling page are configured without reload.

All parameters changed in Option Configure page are configured without reload.

Except “ACD”, “Shared Call Appearance”, “Conference Mode”, “Start Spare FK” and “BLF Type”, all parameters changed in Call Features page are configured without reload.

Apart from “Use Secure outgoing calls if possible”, “Silence Suppression”, “Acoustic Echo Cancellation (AEC)”, “Packet Loss Compensation”, all parameters changed in Advance page are configured without reload.

CCBS Enable/Disable

A new parameter is added for CallBack feature. This parameter is configurable in common config file and telnet.

auto_cb = 0/1

// 1: Enable CallBack feature

Date	Hour	Icons
Remote Unavailable!		
XXXXXXXXXX		
CBack		Back

// 0: Disable CallBack feature

Date	Hour	Icons
Remote Unavailable!		
XXXXXXXXXX		
		Back

The default value is 1.

Via APS

APS in [ipp] section of both Common and Specific-MAC config files with the new parameter – **auto_cb**.

```
[ipp]
...
auto_cb=1 // Enable (default)
...
```

Via Telnet

To configure, open a command line console, and telnet the phone:

Example:

1. Auto_cb is set to enable (**lcdui set auto_cb 1**)

```
[administrator]# lcdui set auto_cb 1
LcdUi Set Command OK!

[administrator]#
```

2. Auto_cb is set to disable. (**lcdui set auto_cb 0**)

```
[administrator]# lcdui set auto_cb 0
LcdUi Set Command OK!

[administrator]#
```

Then type **commit** and then **activate** to apply the change.

Security Features

In this section, you will know more about the operation of the features of SIPS/TLS/SRTP on the phone.

Overview:

Basically, SIPS/TLS/SRTP can be enabled/disabled separately by configuration.

Enabling means the feature is default option for outgoing actions only, and switching on-off mechanism is supported according to capability of remote side, no matter the feature is enabled or disabled.

SIPS

1. Switching to SIPS if receiving SIP message contained uri type (sips:)
2. Switching to SIPS if outgoing uri type is (sips:): for example: speed dial a SIPS uri etc...

TLS

3. TLS would be activated together with SIPS
4. The cipher-suites of TLS is supported by OpenSSL library(0.9.7d), and cipher-suites negotiation is supported according to capability of remote side
5. Switching transport layer to TLS while receiving SIP messages with any one of following content:
 - Transport parameter(transport=tls) in Contact and Record-Route header etc...
 - Uri type (sips:)
4. Support the Import/Export certification and private key via Web interface

SRTP

6. Switching to RTP or SRTP according to capability of remote side described on SDP.
7. Supported crypto-suites:
 - AES_CM_128_HMAC_SHA1_32
 - F8_128_HMAC_SHA1_80
 - AES_CM_128_HMAC_SHA1_80
8. Crypto-suites negotiation is supported according to capability of remote side described on SDP

Feature Activation

Via WebGui

Visit the SETUP → Basic Setup → select Profile page, as shown like below:

With the activation of **SIPS + TLS**, you are required to upload a Certificate and Private Key for authentication on the phone. Set port to be **5061**. The certificate from trusted authorities can be imported to create an internal Certificate Authority (CA).

Visit the SETUP → Basic Setup → SIPS page

Via APS

APS in [sip] section of both Common and Specific-MAC config files with the new parameters:

For **SIPS**, the parameters are **URLTypeMP[profile_id]** = and

URLTypeBk[profile_id] = ,

where, 0 – sip URL type, (default)

1 – tel URL type,

2 – sips URL type

```
[sip]
...
URLTypeMP1=0           // sip url type for profile 1
URLTypeMP2=1           // tel url type for profile 2
URLTypeMP3=2           // sips url type for profile 3
URLTypeMP4=0           // sip url type for profile 4

URLTypeBK1=0           // sip url type for backup profile 1
URLTypeBK2=1           // tel url type for backup profile 2
URLTypeBK3=2           // sips url type for backup profile 3
URLTypeBK4=0           // sip url type for backup profile 4
...
```

For **TLS**, the parameters are **TransportFlgMP[profile_id]** = and

TransportFlgBK[profile_id] = ,

where, 0 – UDP (default)

1 – TCP

2 – TLS

```
[sip]
...
TransportFlgMP1=0      // UDP for profile 1
TransportFlgMP2=1      // TCP for profile 2
TransportFlgMP3=2      // TLS for profile 3
TransportFlgMP4=2      // TLS for profile 4

TransportFlgBK1=0      // UDP type for backup profile 1
TransportFlgBK2=1      // TCP type for backup profile 2
TransportFlgBK3=2      // TLS type for backup profile 3
```

```
TransportFlgBK4=2 // TLS type for backup profile 4
...
```

APS in [sys] section of both Common and Specific-MAC config files with the new parameters:

For **SRTP**, the parameter is **SRTPFlag=** , where 0 disable (default), 1 - enable.

```
[sys]
...
SRTPFlag=1 // Disable (default)
...
```

Via Telnet

To configure, open a command line console, and telnet the phone:

Example:

1. SIPS URL type is set for profile 1

```
[administrator]# sip set url_ttypemp 1 2
[OK] Set OK

[administrator]# sip show url_ttypemp 1
SIP : URL Type 1 = SIPS
```

2. TEL URL type is set for backup profile 1

```
[administrator]# sip set url_typebk 1 1
[OK] Set OK

[administrator]# sip show url_typebk 1
SIP : URL Type 1 = TEL
```

3. Set TLS to be SIP transport for profile 1

```
[administrator]# sip set transportmp 1 2
[OK] Set OK

[administrator]# sip show transportmp 1
SIP : TransportMP20 = TLS
```

4. Set SRTP ON

```
[administrator]# sip set srtp 1
[OK] Set OK

[administrator]# sip show srtp
SRTP : ON
```

Improve HTTPS APS feature

TB30 HTTPS auto provisioning supports both client and server authentication with using certificates. This improvement is totally enhanced a reliable and secure provisioning based on HTTPS requests from TB30 to server and server to TB30.

With using HTTPS, the file transfer between TB30 and the provisioning server are protected. The encryption method for the data between TB30 and server is based on symmetric key cryptography. This methodology makes use of a secret key, which is shared between TB30 and the provisioning server over a secure channel. It ensures that the server and TB30 cannot be interfered by other devices on the network.

Moreover, server and client authentication is performed using public/private key encryption, with certificates containing the public key. Files encrypted with a public key can be decrypted only by its corresponding private key (and vice versa).

In server side, you should have an SSL server certificate. TB30 will recognize only the certificate in the server side and try to authenticate the certificate when connecting via HTTPS, or reject any server certificate if not valid.

Likewise, in client side, TB30 should also carry a unique client certificate which is used to identify information about each individual server.

Therefore, before doing HTTPS APS, the phone needs to have the certificate and the private key imported via webGui. And the server certificate should also be ready as well.

Feature Activation

Via WebGui

To import the client certificate in TB30, you can visit the SETUP → Basic Setup → HTTPS page, as shown like below:

Click the import button to upload the certificate and private key files.
Click the import button to upload the certificate authority root certificate.

You are also able to export the certificate by clicking Export.

Finally, press "Apply" to save the change.

Support Encryption of Configuration files in APS

For TB30, the transfer of encrypted configuration files is supported to prevent data exposure during APS.

Encrypted files support:

- Common configuration file (Comconfig file)
- MAC configuration file (MacConfig file)

Encryption method:

Symmetric method, advance encryption standard (AES) 128bit

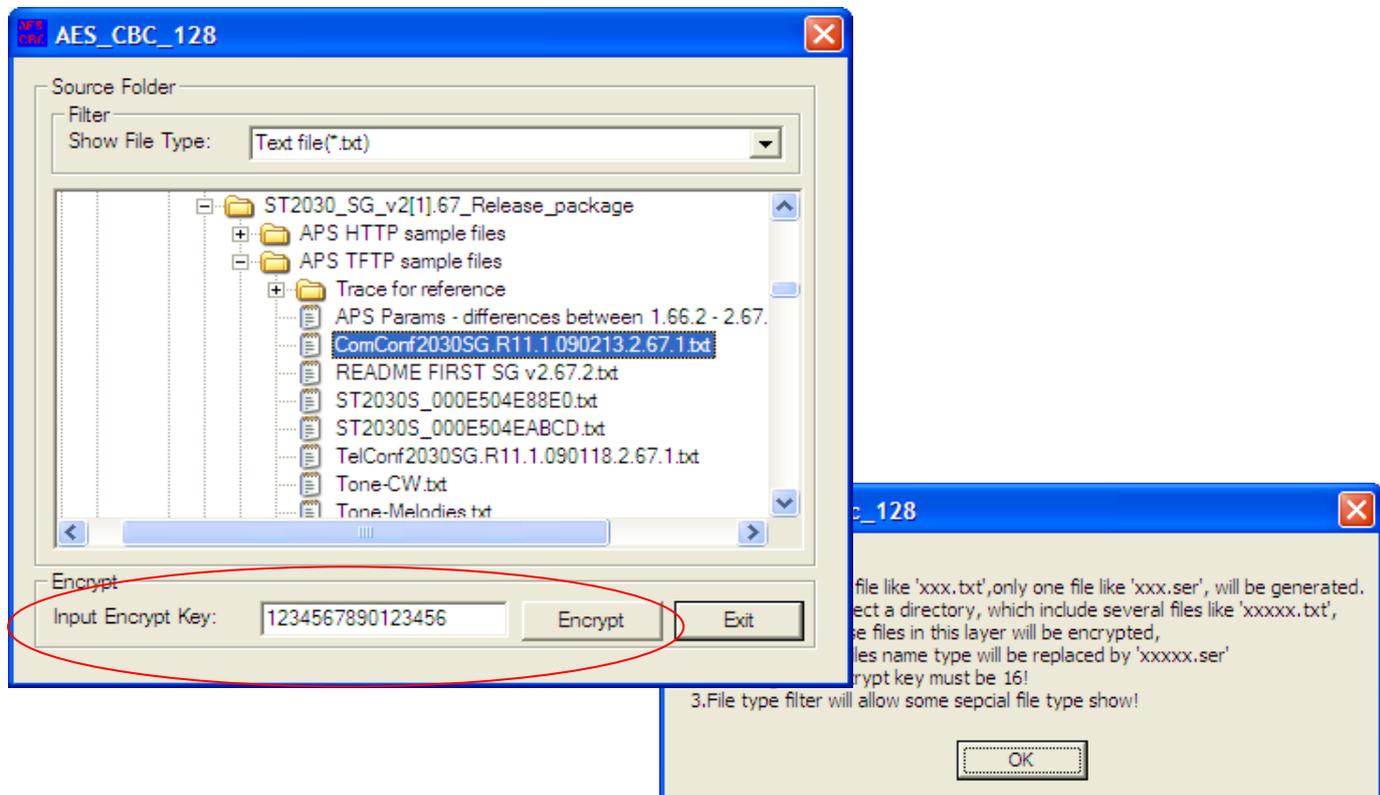

Encryption/Decryption tools:

- Name: Window_Aes_cbc_128.exe (including in release package/Decryption tool folder)
- Press F1 for get HELP window

In Window Platform

File name: Window_Aes_cbc_128.exe in ../Encryption Tool folder.

Select the Configuration file and input a 16-digits key for encryption. Press [Encrypt] to start the process. Press 'F1' to get help window for more information.

In Linux Platform:

Filename: Linux_aes_cbc_128_bin.tar.gz ../Encryption Tool folder.

- ➔ tar zxvf FileName.tar.gz
- ➔ cd FileName
- ➔ ./aes_cbc_128 <key> <source file or directory> <destination file or directory>
- ➔ `*.ser` file will be generated

```

```

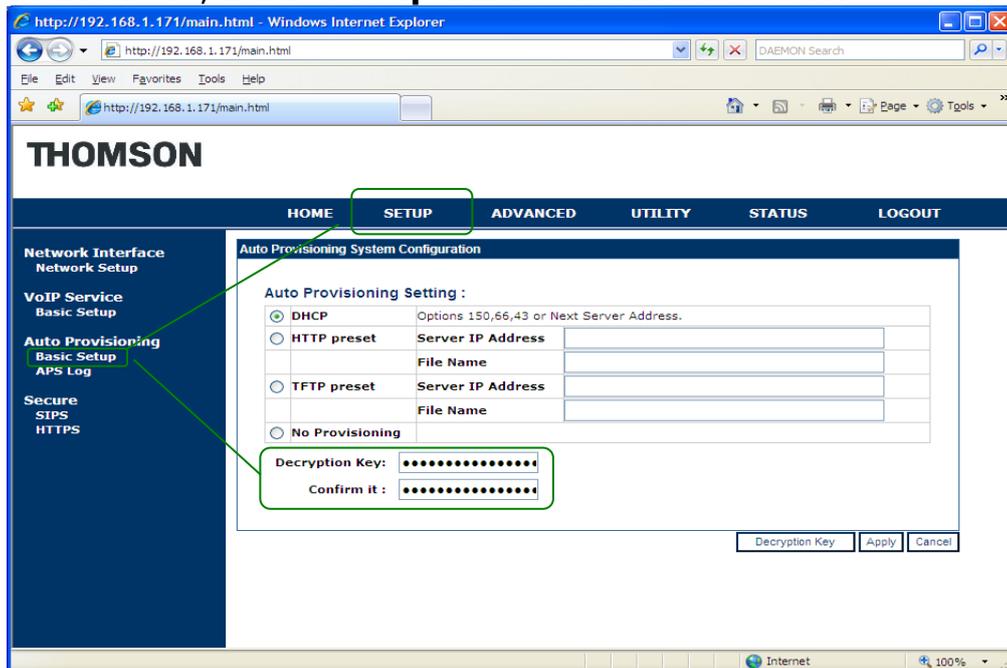

Things to know:

The ComConfig/ MacConfig file should be encrypted with symmetric key offline before doing APS. The decryption will be handled on the phone by using the same key.

Feature Activation

Via WebGui

Visit the **SETUP** ➔ , **Basic Setup** will be shown like below:

Input the decryption key (16 digits) in the field and confirm field. If the key is different with the key for confirmation, an error message will prompt you to input the key again.

Press the [**Decryption key**] to save the key settings in the phone.
→ Phone reboot.

If the key doesn't match with the key for encrypted files during APS, the files are not allowed to download to the phone.

You are recommended to check the **APS log** after doing APS to make sure its process is running correctly.

APS log (if Decryption key Match):

```

Begin Common Config download...
AES decrypt common config file successfully!
CommonConfig: ComConf2030SG.R11.1.090213.2.67.1.ser download successfully!
Begin Mac config download...
MacConfig: TB30S_00147F00DFE4.ser download successfully!
AES decrypt mac file successfully!
Serial number is the same!
Begin upgrading config file...
Check config file syntax
Check config file syntax successfully!
Upgrading config file successfully!
    
```

APS log (if Decryption key not-Match):

```

Begin Common Config download...
AES decrypt common config file successfully!
CommonConfig: ComConf2030SG.R11.1.090213.2.67.1.ser download successfully!
Begin Mac config download...
MacConfig: TB30S_00147F00DFE4.ser download successfully!
AES decrypt mac file successfully!
Error: Parse config file failed or config_sn tag not found!
Begin upgrading config file...
Check config file syntax
Error: Config file format error
    
```

On the **MMI** of the phone, you also be noted that the **Provision Error!** displaying on the screen when the .ser is failed to download.

Via APS

APS in [autoprovision] section of both Common and Specific-MAC config files with the new parameter:

Decryption_Key=Th0mson2\$8s8@9z! (Default)

```

[autoprovision]
...
Decryption_Key=Th0mson2$8s8@9z!
...
    
```

Call Dialing from WebGui

TB30 provides the convenience for user to dial an outgoing call, reject and hang up incoming call on the web interface.

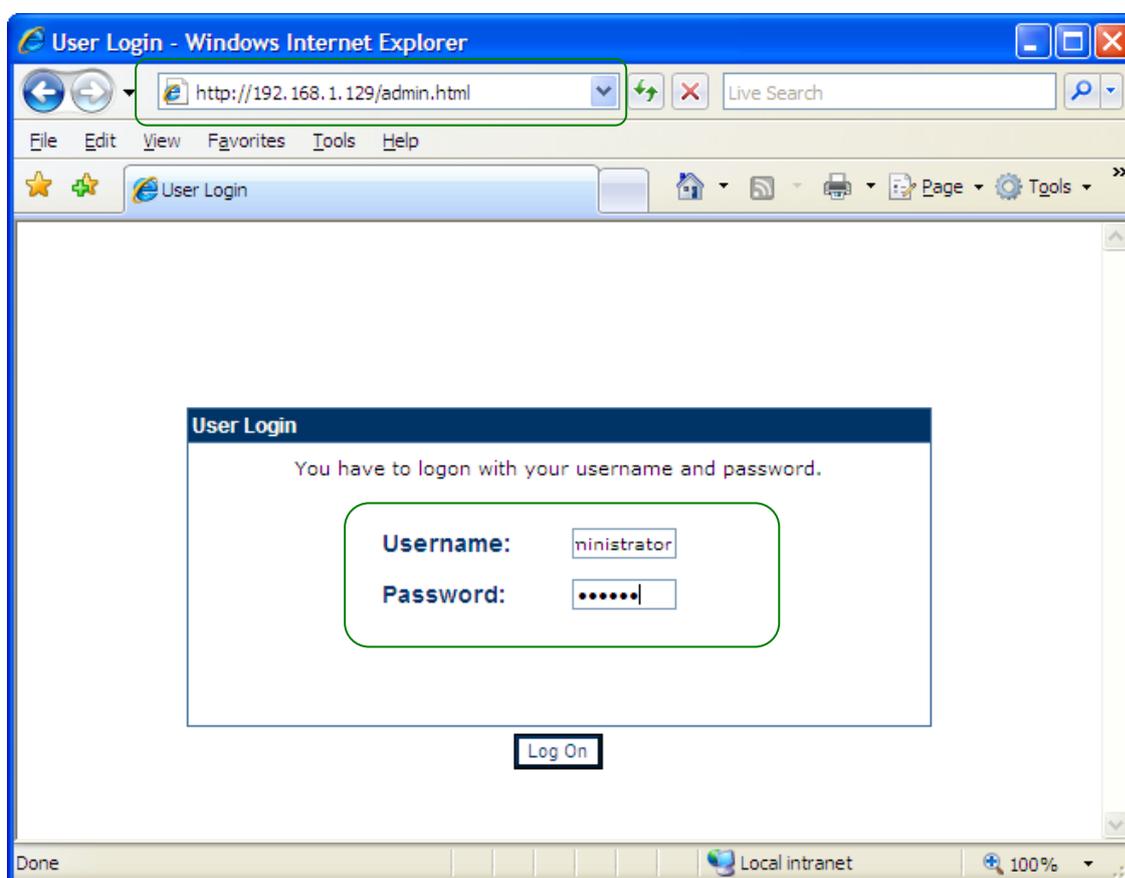

Feature Activation

Web interface

Enter the IP address of phone on the web browser

Enter the **Username** and **Password**

- Username(default): administrator
- Password(default) : 784518

Visit the **ADVANCED** → **Dialling Call** page, the Dialling Call interface will be shown like below:

THOMSON

To make an outgoing call, you can just choose the active outgoing identity from the pull-down menu of Line Account, and input the telephone numbers or SIP URL in the field. Click the  icon to make an outgoing call. A status will be shown on the screen to indicate the call is successfully dialed out. Hang up the call by clicking the  icon.

The Dial key  has the following behaviors:

If the number is valid in the field,

1. In idle mode, dial out a call after pressing the key
2. Incoming call mode (Ringing), Line 2 will be used to dial out a call after pressing the key
3. Taking mode, the current call will be held and used Line 2 to dial out a call after pressing the key

No action is taken if the field is empty.

Also, the EndCall key  has the following behaviors:

1. Dailing mode, stop the outgoing call and return to idle mode after pressing the key
2. Incoming call mode (Ringing), reject the call and return to idle mode after pressing the key
3. Taking mode, hang up the call after passing the key

Call Logs

Same as the local phone, there are 3 call logs supported on the web interface, including **Missed Call log**, **Received Call log** as well as the **Dialed Call log**.

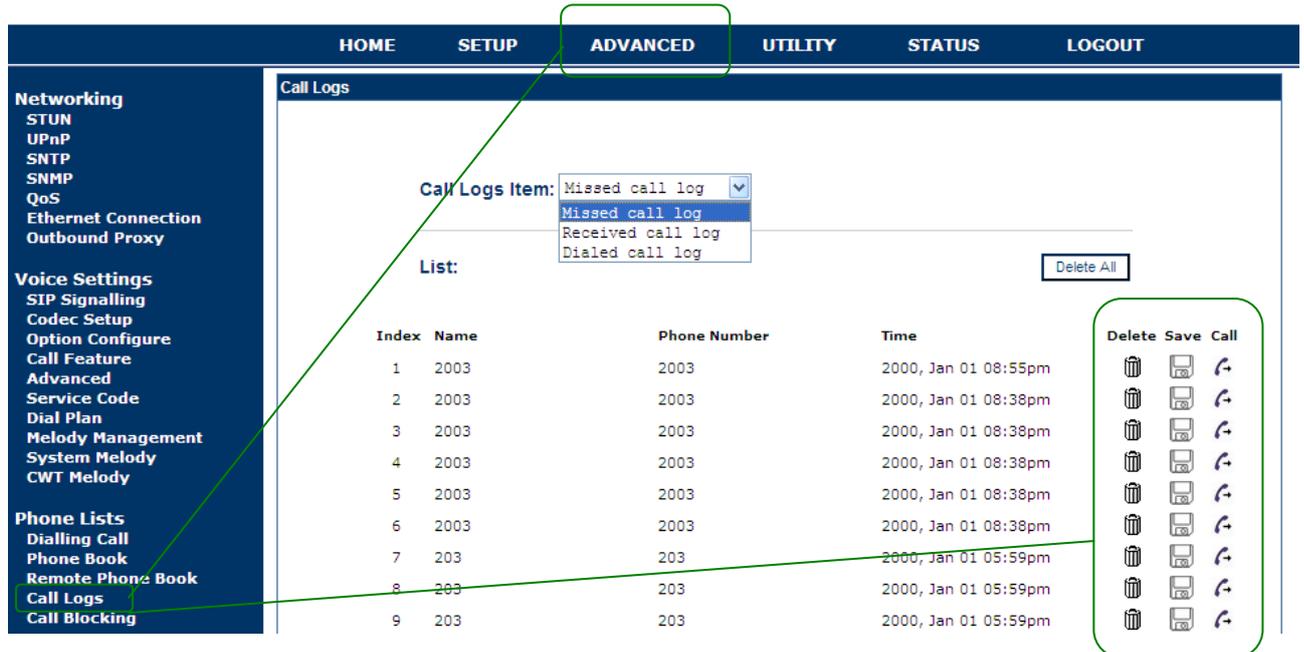

You can press the Call logs key from Call dialling page or go to ADVANCED → Call Logs to access the page. Select the check logs by pulling-down the Call log menu.

The maximum entries in each call log are **30**.

In the call log page, you are allowed to delete entry, save entry and call back to the entry if you want.

- Click  to delete the entry
- Click  to save the entry in phone book
- Click  to access to the call dialling page to make an outgoing call

THOMSON

Call Logs

Call Logs Item: Missed call log

List:

Index	Name	Phone Number	Time

Add

SIP Message during call (rfc 3428)

TB30 not only supports the receiving message in idle mode, but also in conversation mode.

The existing parameter still keeps using with purpose to avoid attacks. Messages coming from other servers which were not the configured one on parameter will be rejected.

From the below network trace, it shows that the phone receives SIP message "TB30s SIP Message testing" from server side.

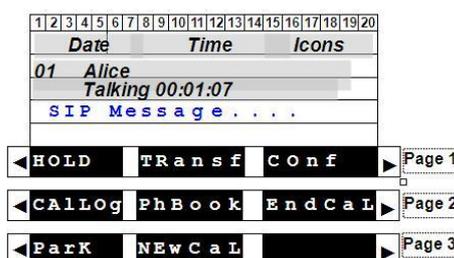

```

3061 42.043581 192.168.1.3 192.168.1.105 SIP Request: MESSAGE sip:2812@192.168.1.105 (text/plain)

  Request-Line: MESSAGE sip:2812@192.168.1.105 SIP/2.0
  Message Header
  Message Body
    Line-based text data: text/plain
      ST2030s SIP Message testing \r\n
  
```

The text contained in the SIP MESSAGE body is displayed on the 4th line of the LCD for TB30.

SIP MESSAGE text location on TB30:

Feature Activation

Same as the current implementation. This feature does not need specific activation to be supported. With using the current parameter, it is to avoid messages attacks from non desired sources.

The parameter is AuthMessageServer. Default value is 0.0.0.0, which means phone accepts all messages received from everywhere. Otherwise, to limit from which server messages can be accepted, this parameter should contain either SIP messages server IP address or domain name.

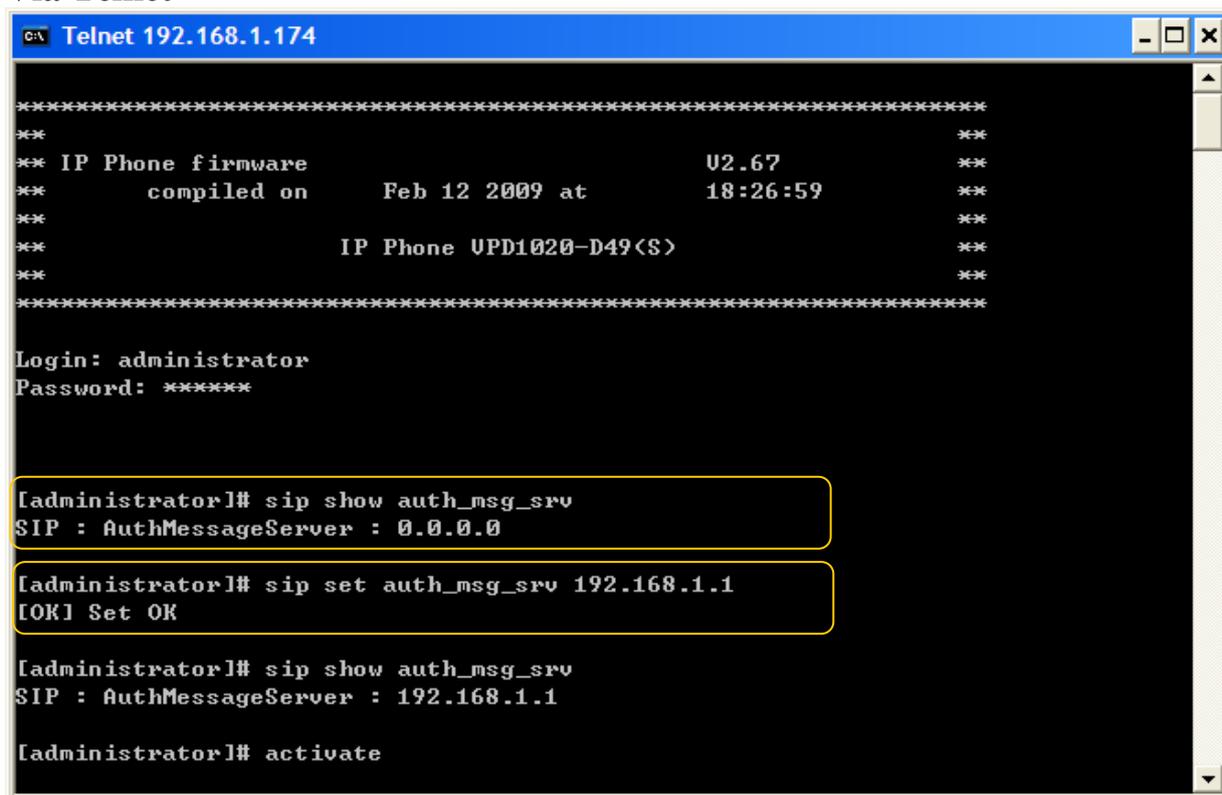

Via APS

This parameter only can be configured in section [sip] of common or MAC config files.

For example:

```
[sip]
...
AuthMessageServer=192.168.1.1 (or AuthMessageServer=domain.com)
...
```

Via Telnet

```
c:\ Telnet 192.168.1.174

*****

[administrator]# sip show auth_msg_srv
SIP : AuthMessageServer : 192.168.1.1

[administrator]# activate
```

DNS Query (Circular Method)

TB30 has done an improvement on the mechanism of the DNS Query, which increases the efficiency on the DNS request.

A new parameter "**DNSFB**" is introduced and found in Common and MAC configuration files.

If the value of the parameter is **0**, the phone always queries to the Pri DNS server.

While, if the value of the parameter is **1**, DNS query will be using a circular method, which the phone always starts with the DNS that has provided the answer to the previous request. If the DNS fails, then try the other and if the other answers, then use the other in subsequent requests until this one fails. and so on.

The parameter is configurable via APS and Telnet.

Feature Activation

Via APS

APS in [net] section of both Common and Specific-MAC config files with the new parameter:

```
[net]
DNSFLG=1
DNSFB=0
DSCPflag=0
ESWITCH_LAN=1
ESWITCH_PC=1
```

Via Telnet

To configure, open a command line console, and telnet the phone:

```
C:\ Telnet 192.168.1.129
*****
**

```

Support Remote call logs for local user

Remote call logs are currently supported for login/logout function in TB30. However, it doesn't support for normal user.

Implementation

Actually, the implementation of the remote call-log is the same as the call log for login/logout, expect for normal user this time.

The call-log file contains 3 sections: the missed calls, the received calls and the dialed calls. Each section can have up to 30 calls.

The calls shall be classified from the most recent to the oldest.

Each call is described by the phone number, phone name, date and time of the call. The call-log will use the following XML format.

```
<ThomsonRemoteCallLog>
  <MissedCalls>
    <Call>
      <Name>John</Name>
      <Telephone>01234</Telephone>
      <Date>20070626</Date>
      <Time>0130PM</Time>
    </Call>
    <Call>
      <Name>Jack</Name>
      <Telephone>56789</Telephone>
      <Date>20070625</Date>
      <Time>0315PM</Time>
    </Call>
    <Call>
      <Name></Name>
      <Telephone>98765</Telephone>
      <Date>20070620</Date>
      <Time>0915AM</Time>
    </Call>
  </MissedCalls>
  <ReceivedCalls>
    <Call>
      <Name>James</Name>
      <Telephone>34567</Telephone>
      <Date>20070627</Date>
      <Time>0845AM</Time>
    </Call>
  </ReceivedCalls>
  <DialedCalls>
    <Call>
      <Name>John</Name>
      <Telephone>01234</Telephone>
      <Date>20070625</Date>
      <Time>0245PM</Time>
    </Call>
  </DialedCalls>
</ThomsonRemoteCallLog>
```

(name not available)

Each time user enters in the call log menu by pressing the “**CalLog**” softkey, the phone will download the relevant file from the server using the HTTP GET method.

A new parameter “**RCallLogFlg**” is introduced to decide enabling either local call-log or remote call-log.

The default value is 0, which means the local call log is enabled, While, the value is 1, which means the remote call log is enabled.

In addition, the URL for this remote call-log file is configurable using a new parameter: “**RCallLogURL**”.

The data are stored on the phone until the user quits the call log menu by pressing [Back] soft key or “C” key or the phone returns to the idle screen after a timeout.

Feature Activation

Via WebGui

Visit ADVANCED → advanced, click the support Remote call logs check box. Enter the remote call log URL in the field.

THOMSON

The screenshot shows the Thomson Web GUI interface. At the top, there is a navigation bar with tabs: HOME, SETUP, **ADVANCED**, UTILITY, STATUS, and LOGOUT. On the left, there is a sidebar menu with categories: Networking, Voice Settings, Melody Management, and Phone Lists. Under 'Voice Settings', 'Advanced' is selected. The main content area is titled 'Advanced' and 'Telephone Settings'. It contains several configuration options:

- DTMF: Out of Band (RFC2833) (dropdown)
- RTP Payload Type: 96 (96-127)
- RTP DTMF Level: 0 (0-63)
- Use Secure outgoing calls if possible
- Silence Suppression
- Acoustic Echo Cancellation (AEC)
- Packet loss compensation
- '#' will be processed as normal digits
- Support manual login-logout
- RegEventServer: [] @ 0.0.0.0
- PSettingURLd: []
- PSettingURLul: []
- PCallLogURL: []
- Support Remote Call logs
- RCallLogURL: http:// []

 A green box highlights the 'Support Remote Call logs' checkbox and the 'RCallLogURL' field. A green line points from the 'ADVANCED' menu item in the top navigation bar to the 'Advanced' sub-menu in the left sidebar.

Via APS

An **RCallLogFlg** parameter is created and added in the [sys] section of both Common and Specific-MAC config files.

RCallLogFlg = 0, (by default), the local call logs will be in use.

RCallLogFlg = 1, the remote call logs will be in use, instead.

An **RCallLogURL** parameter should be added in the [sys] section.

This parameter is set with the URL used to download the file containing the remote call log.

Examples:

RCallLogURL=http://192.168.1.1/search.php?Name=call_log&number=#LOGIN&IP_addr=#IP&mac=#MAC&pass=#PASSWORD

RCallLogURL=https://192.168.1.1/search.php?Name=call_log&number=#LOGIN&IP_addr=#IP&mac=#MAC&pass=#PASSWORD

Where,

#LOGIN is the phone number of the active profile

#PASSWORD is the SIP password of the active profile

#IP is the IP address of the phone

#MAC is the MAC address of the phone

```
[sys]
...
RCallLogFlg=1 // the remote call logs is enabled
RCallLogURL=http://
...
```

Transfer On ringing

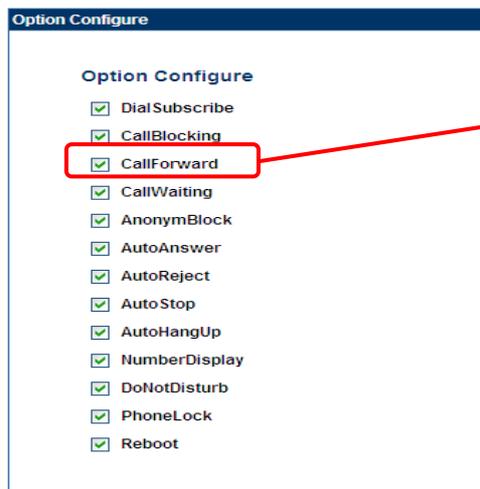

[Transf] softkey should be able to show on ringing in MMI selectively with/without respect to the CallForward bit in parameter "OptionVisible".

Current implementation

Since x.61, [Transf] softkey enable/disable on ringing in MMI with respect to the call forward bit in parameter "OptionVisible" accordingly.

In other words,
CallForward bit in parameter "OptionVisible" = 1 → [Transf] softkey on ringing shows on the screen.

CallForward bit in parameter "OptionVisible" = 0 → [Transf] softkey on ringing NOT shows on the screen.

[Transf] softkey enable/disable on ringing in MMI is directly followed the activation / deactivation of callforward bit accordingly.

New Implementation

A new parameter in Common and MAC configuration files is added to increase the flexibility to assign the [Transf] softkey on ringing shown in MMI with/without respect to the call forward bit in parameter "OptionVisible" accordingly.

TransfOnRingFlag = <0/1>, 0 is disable (by default), 1 is enable

TransfOnRingFlag = 0, [Transf] softkey is always enable without respect to the call forward bit in parameter "OptionVisible".

TransfOnRingFlag = 1, [Transf] softkey with respect to the call forward bit in parameter "OptionVisible" enable/disable. (Same as the current implementation above)

Table below describes the Enable/Disable of the [Transf] softkey on Ringing with Call forward bit in "OptionVisible".

	Call forward bit in "OptionVisible" = 0	Call forward bit in "OptionVisible" = 1
TransfOnRingFlag = 0	Enable	Enable
TransfOnRingFlag = 1	Disable	Enable

Feature Activation

A new parameter is needed to configure this function and with some additional definitions listed below.

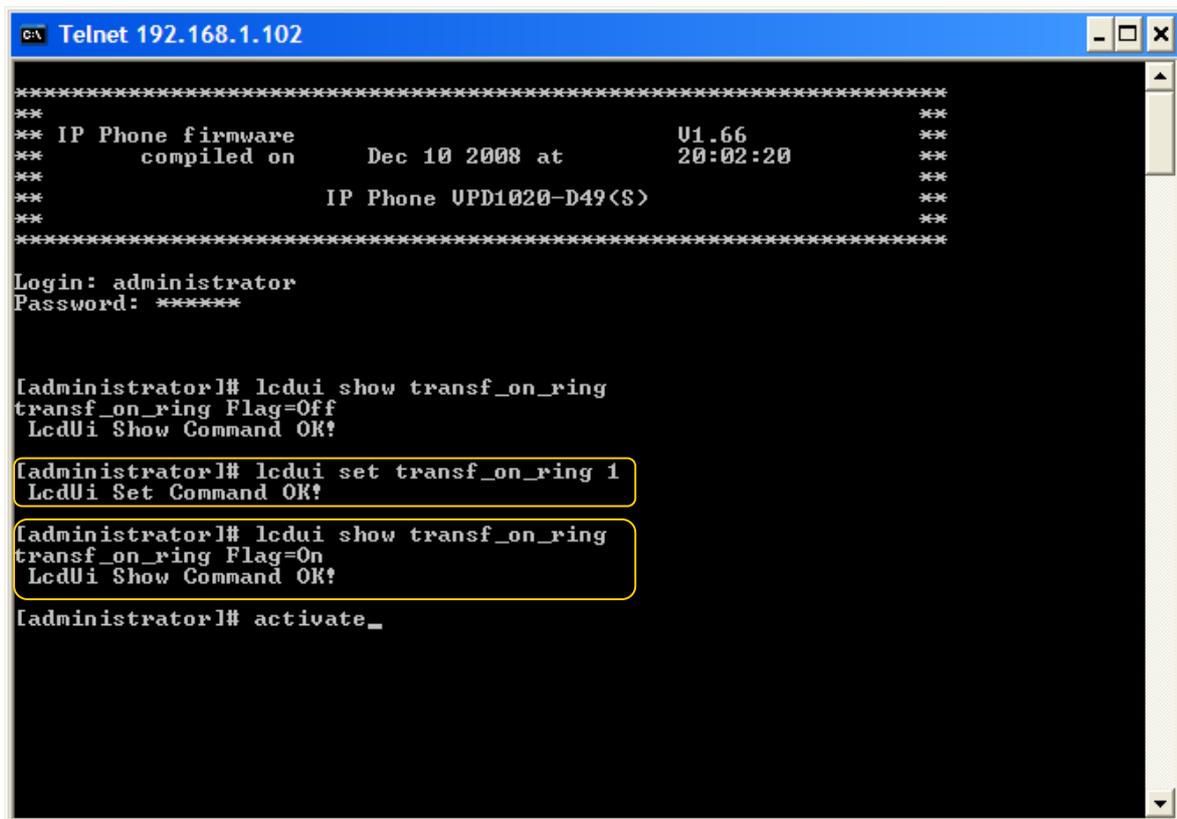

Via APS:

APS in [ipp] section of both Common and Specific-MAC config files with the new parameter:

```
[ipp]
...
OptionVisible=8191
TransfOnRingFlag =0           //by default, transfer on ringing is always enabled
.....
```

Via Telnet

To configure, open a command line console, and telnet the phone:

```
C:\ Telnet 192.168.1.102
*****
** IP Phone firmware          U1.66          **
**   compiled on      Dec 10 2008 at    20:02:20    **
**                               IP Phone UPD1020-D49(S) **
**                               **
*****

Login: administrator
Password: *****

[administrator]# lcdui show transf_on_ring

[administrator]# lcdui show transf_on_ring
transf_on_ring Flag=On
LcdUi Show Command OK!

[administrator]# activate_
```

Call-hold “inactive” method

To enhance the compatibility with different softswitches, a new call-hold method is introduced in this section.

Current implementation

Currently, TB30 implements “**send-only**” method for holding a call, carried in SDP session.

```
Content-Type: application/sdp
Content-Length: 221

v=0
o=2215 1325412 1325413 IN IP4 192.168.1.102
s=-
c=IN IP4 192.168.1.102
t=0 0
m=audio 41000 RTP/AVP 18 96
a=rtpmap:18 G729/8000
a=fmtp:18 annexb=no
a=rtpmap:96 telephone-event/8000
a=fmtp:96 0-15
a=sendonly
```

Now, an alternative new call-hold method “**inactive**” has implemented in TB30 to enhance the compatibility working on different softswitches.

```
Content-Type: application/sdp
Content-Length: 221

v=0
o=2215 1807412 1807413 IN IP4 192.168.1.102
s=-
c=IN IP4 192.168.1.102
t=0 0
m=audio 41000 RTP/AVP 18 96
a=rtpmap:18 G729/8000
a=fmtp:18 annexb=no
a=rtpmap:96 telephone-event/8000
a=fmtp:96 0-15
a=inactive
```

Feature Activation

A new parameter is needed to configure this function and with some additional definitions listed below.

call_hold_method=<0|1>, 0 is by default
 call_hold_method=0, "send-only" call-hold method is used
 call_hold_method=1, "inactive" call-hold method is used

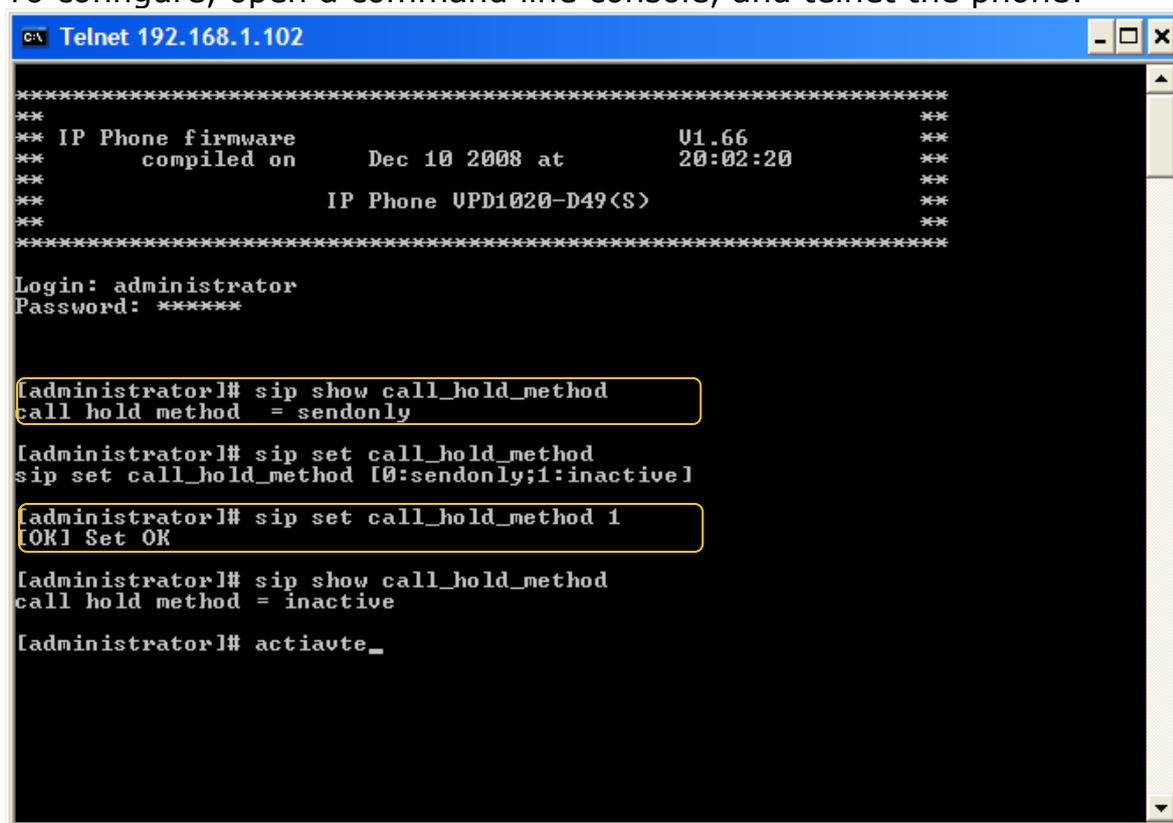

Via APS:

APS in [sip] section of both Common and Specific-MAC config files with the new parameter:

```
[sip]
...
call_hold_method=0           // by default, "send-only" is in use
.....
```

Via Telnet

To configure, open a command line console, and telnet the phone:

Comverse: Line and Service supervision (reg & ua-profile event package)

The purpose of this feature is to increase the ability of TB30 to request and monitor the registration status, change user profile and receive notifications related to a set of services of other supervised SIP phones in Comverse environment, like:

- DND activation status
- Call Forward activation status
- Etc...

Busy Line Field (BLF)

Dialog event supervision

User-oriented BLF has already supported in TB30. In Comverse environment, this feature allows monitoring other line status, and speed dialing.

For each supervised phone, TB30 generates an initial SUBSCRIBE request to the SIP server in order to be notified for the state of all dialogs for this specific agents.

Then, the network generates a NOTIFY request on any dialog update for the supervised PUI. The dialog states are « **Early** », « **Confirmed** » and « **Void** » (state not provided).

Upon reception of a NOTIFY request, the TB30 updates the lamp associated to the supervised phone accordingly.

For User-oriented BLF service, please refer to the *TB30 SIP New Features SG vx.52.1 P.230*

Registration event supervision with DND

One new feature is added in TB30 for working in Comverse environment. This feature allows TB30 to monitor other line registration status with DND of the supervised phones.

For each supervised phone, TB30 generates an initial SUBSCRIBE request to the SIP server in order to be notified for the state of all registrations for this specific phone.

Afterwards, the network generates a NOTIFY request on any registration update for the supervised PUI. The registration states are « **Registered** » and « **Unregistered** ». The service variable for DND supervision will be discussed in next section.

Upon reception of a NOTIFY request, TB30 update the lamp associated to the supervised phone accordingly.

Implementation and configuration

Table below describes an overall TB30’s behavior that is used for implementation, based on the **Dialog** and **Registration** and **DND supervision** of a same target:

DND state	Registration State	Dialog state	Aggregated state	Lamp state	When BLF Key is pressed
Off	Registered	Void	Free	Off	Call initiate
		Early	Ringing	Blinking fast	Call pick up
		Confirmed	Busy	On	Call initiate
	Unregistered	Any	Not available	Blinking slow	No action
On	Any	Any	Not available	Blinking slow	No action

If user presses the function Key:

- BLF Key is pressed in **OFF** state --> phone initiates a call toward the supervised SIP-URI
- BLF Key is pressed in **STEADY ON** state --> phone initiates a call toward the supervised SIP-URI
- BLF Key is pressed in **BLINKING SLOW** state --> NO action is taken
- BLF Key is pressed in **BLINKING FAST** (supervised phone is ringing) state --> phone launches a call Pickup of the supervised phone

Call pickup is launched by initiating a call toward a service code that includes the number to pickup. It can work with Soft Key or with Function key (user orientated BLF)

For call pick up service, please refer to “TB30 SIP New Features SG vx.62 P. 145 → How to activate call Pick-up Service.

Remark:

If the status of the phone is in ringing, in communication and all others, except idle, function key should remain inactive if the user presses them. But, the supervision (LED blinking or other, including state change) should remain active during call.

Service variable supervision

Now, TB30 has already implemented the service variable supervision, the "ua-profile" event package is supported. But working in Comverse environment, this feature has been enhanced, which not only allows supervising phone itself, but also supervised with other phones.

The service allows TB30 to be periodically notified about the state of a set of services implemented by the network. As mentioned before, those are

- DND activation status
- Call Forward activation status
- Etc...

There are three stages for the profile delivery process, including **Enrollment**, **Content retrieval** and **Change notification**. This document will not go into detail. For more information, please refer to "TB30 SIP New Features SG vx.62 P. 145

The service variables are defined in the below table:

Name	Possible values	Description
cfu_on	Integer: { 0, 1 }	Activation state of the Unconditional Call Forward. 0 means deactivated. 1 means activated.
dnd	Integer: { 0, 1 }	Activation state of the Do Not Disturb feature. 0 means deactivated. 1 means activated.
sf_on	Integer: { 0, 1 }	Activation state of the Secretarial Filtering feature. Applicable only when a Manager line is supervised. 0 means deactivated. 1 means activated.
hg_rdy	Integer: { 0, 1 }	Indicates whether the CPE that initiated the supervision is ready on the supervised Hunt Group. Applicable only when a Hunting Group virtual line is supervised. 0 means not ready. 1 means ready.

Where,

- CallFwd service is linked to "cfu_on" variable
- DND service is linked to "dnd" variable
- SecFilter service is linked to "sf_on" variable
- HuntGroup service is linked to "hg_rdy" variable

When TB30 receives the SIP NOTIFY message, indicating successful profile enrollment, it makes it effective immediately and displays service status to the user. The duration of the subscription is 3600 by default.

Implementation and configuration

One function key will be affected to each service. Depending on the state of the service, the corresponding function key’s LED will be turned ON or OFF.

Referring to the above table, two status of service variable are well defined:

- 0 means Deactivation state
- 1 means Activation state

Table below describes lamp state with the corresponding variable state.

Variable State	Lamp state
0	Off
1	On

Service supervision is associated to a key of the phone; TB30 provides the ability to change the variable state by pressing the key. In all cases, it exists one couple of activation/deactivation for each supervised service of the supervised phone.

Activation and deactivation consists in initiating a basic call toward the corresponding supervised phone, where the phone used depends on the current status of the service.

Table below describes the two services which are used for activation / deactivation for the supervised phone in Comverse environment.

Services	Variable State	Lamp state	When key is pressed	FCA
Secretarial Filtering	0	OFF	INVITE sip: *270x*@domain.com SIP/2.0 From: <...> To: <sip:*270x*@domain.com> (Where x is the phone number of manager)	*270x*
	1	ON	INVITE sip: *271x*@domain.com SIP/2.0 From: <...> To: <sip:*271x*@domain.com> (Where x is the phone number of manager)	*271x*
Hunting Group	0	OFF	INVITE sip: *70x#@domain.com SIP/2.0	*70x#

			From: <...> To: <sip:*70x#@domain.com> (where x is the hunt group extension)	
	1	ON	INVITE sip: *71x#@domain.com SIP/2.0 From: <...> To: <sip:*71x#@domain.com> (where x is the hunt group extension)	*71x#

Remark:

- **Call Forward:** it is only possible to activate/deactivate for the self phone. Not support for the supervision of other phone in this case.
- **DND:** it is also only possible to activate/deactivate for the self phone. Not support for the supervision of other phone in this case.
- **SecFilter:** it is supported to activate/deactivate for the supervised phone.
The typical use case allows a secretary to have information on his/her phone by using a LED of the activation status of the Secretarial Filtering on the Line of the Boss. By pressing the feature key, secretary can change the activation status of the secretarial filtering on the boss line.
- **HuntGroup:** it is supported to activate/deactivate for the supervised phone
The typical use case allows a Hunting Group Member to have information on his/her phone by using a LED of his/her logon status regarding in a given Hunting Group. By pressing the feature key, member can change the logon status in this Hunting Group.

Feature Activation

Below is the typical example, including the supervision of self phone and other phones, with making use of the governed parameters below:

- A (2001) is the self-phone number.
- B (2003 ~ 2005) supervised phone lines
- D (2007) is the Boss phone number
- E (2022) is the Hung group number

FK1 & FK2: Line
FK3 to FK4: Use to supervise others phone with dialog, registration and DND services (Supervised phones: 2003 to 2004)

- FK5 to FK6:** Use to monitor the status of CFW and DND of the supervised phone (Supervised phones: 2005)
- FK7:** CFU (Self Phone) LED indicates ON/Off, Press Key for activation or Deactivation depends on the current status of the service.
- FK8:** DND (Self Phone) LED indicates ON/Off, Press Key for Activation or Deactivation depends on the current status of the Service.
- FK9:** Use to supervise other phone with SF service. LED indicates ON/Off, Press Key for Activation or Deactivation depends on the current status of the Service.
- FK10:** Use to supervise other phone with HG service. LED indicates ON/Off, Press Key for Activation or Deactivation depends on the current status of the Service.

Via WebGui:

Firstly, it is required to reduce the number of Multiline to reserve the number of supervised lines in Function Key, in Advanced → Advanced. Change the Multiline to be 2 and apply.

Then, you should go to Function key table through Advanced → Call feature → Function Key table.

Select the item in the roll down “Type” menu: **Supervised Line** and enter the supervised phone numbers in the corresponding field of the function keys.

In this case, the function keys 3 to 4 will monitor the dialog, registration with DND service for the corresponding supervised phones. Therefore, the boxes for **dialog** and **regDND** for each supervised phones are checked.

Likewise, the function key 5 is to monitor the status of CFW and DND of the supervised phones, the **ua-profile** option must be checked. Click the Change TB30(S) to apply.

Then, click the **Detail** button to go into the sub-menu of the **ua-profile**

THOMSON

The screenshot shows the 'Function Key Table' for ST2030(S). The table has columns for FK, Type, Destination, and BLF Option. A red box highlights rows F3 through F8. In row F3, the 'dialog' and 'regDND' checkboxes are checked. In row F6, the 'regDND' and 'ua-profile' checkboxes are checked. A green box highlights the 'Detail' button for row F6. Below the table are buttons for 'Change ST2030(S)', 'Cancel', and 'Back'.

FK	Type	Destination	BLF Option
F 1	Line		<input type="checkbox"/> dialog <input type="checkbox"/> regDND <input type="checkbox"/> ua-profile Detail
F 2	Line		<input type="checkbox"/> dialog <input type="checkbox"/> regDND <input type="checkbox"/> ua-profile Detail
F 3	Supervised Line	2003	<input checked="" type="checkbox"/> dialog <input checked="" type="checkbox"/> regDND <input type="checkbox"/> ua-profile Detail
F 4	Supervised Line	2004	<input checked="" type="checkbox"/> dialog <input checked="" type="checkbox"/> regDND <input type="checkbox"/> ua-profile Detail
F 5	Supervised Line	2005	<input type="checkbox"/> dialog <input type="checkbox"/> regDND <input checked="" type="checkbox"/> ua-profile Detail
F 6	Do Not Disturb	2005	<input type="checkbox"/> dialog <input checked="" type="checkbox"/> regDND <input checked="" type="checkbox"/> ua-profile Detail
F 7	Service Supervision	CallFwd	<input checked="" type="checkbox"/> dialog <input type="checkbox"/> regDND <input type="checkbox"/> ua-profile Detail
F 8	Service Supervision	DND	<input checked="" type="checkbox"/> dialog <input type="checkbox"/> regDND <input type="checkbox"/> ua-profile Detail
F 9	Supervised Line	2007	<input type="checkbox"/> dialog <input type="checkbox"/> regDND <input checked="" type="checkbox"/> ua-profile Detail
F10	Supervised Line	2022	<input type="checkbox"/> dialog <input type="checkbox"/> regDND <input checked="" type="checkbox"/> ua-profile Detail

Enable the **cfu- Call Forward** and **dnd - Do Not Disturb** services by highlighting the service and click the right arrow. Then, click Apply.

For Feature Key 9 and 10, the procedures are the same.

THOMSON

The screenshot shows the 'Bif Ua Srv Setup' screen. It has two columns: 'Disable' and 'Enable'. The 'Enable' column is highlighted with a red box and contains 'cfu--Call Forward' and 'dnd--Do Not Disturb'. An arrow points from 'cfu--Call Forward' to the 'Higher' priority arrow. Another arrow points from 'dnd--Do Not Disturb' to the 'Lower' priority arrow. The 'Apply' button is at the bottom right.

You can also press the up and down arrow to change the priority for the enabled service. The priority is to decide which services would be used to the first assigned function key. The higher the priority, the first assigned function key will be used.

Therefore, the below feature key 5 is assigned with Call forward service and feature key 6 is assigned with DND.

Change ST2030(S) Cancel Back

For the configuration of service supervision of self-phone, it only can be done by APS. Besides, it cannot be modifiable thought neither the MMI nor the WebGui. One of the important topics need to be mentioned is the configuration of the starcode.

In this example, there are several starcodes involved. This document will give a brief description and make use of the startcodes working in Comverse environment. For more detail, please refer to "TB30 SIP New Features SG vx.62" P.145

Remark:

Now, if the Starcodes are used for self-phone, those will be denoted by SC. While, if the Starcodes are used for supervised phones, which will be denoted by SV.

Then, go to Advanced → Call feature; enter the Starcode for **DND On/Off** and **Call Forward**.

Under the **call forward** sub-menu, enter the starcode for Call-forward OFF and call-forward Always ON for the couple of activation/deactivation of the service. x is represented the phone number, which the self-phone forwarded to.

Call Forwarding Number

While	Call Forward
OFF	*211*
Always	**21x**
Line Busy	
No Answer	
On Ringing	

A new page is added called **Service code** in Advanced -> Service code. All the Starcode, which are used for monitoring to the supervised phones will be put there and be denoted by SV.

Enter the starcodes for **SFOnSV** , **SFOffSV**, **HGOnSV** and **HGOffSV** respectively and Apply.

Via APS:

In order not to conflict with the original user-oriented BLF, a new parameter will be added in Common and MAC configuration files to enable the feature of line supervision of registration and service supervision for each function key.

The existing parameters for user-oriented BLF will be used:

Current_Max_Multiline=10 (default)
FeatureKeyExtXX =S/<sip:xxxx>

New parameter:

FeatureKeyOptXX=Dialog(1)regDND(0)ua-profile(0:cfu(0)dnd(0)sf(0)hg(0)),

Where,

0 is disable, 1 is enable

XX is the number function keys used with supported extension modules, from Ext 01~ 66.

- Dialog - current BLF (Dialog only)
- regDND - registration status with DND
- cfu - Un-conditional call forward
- dnd - Do Not Disturb
- sf - Secretary filter
- hg - Hunted group

Default setting:

FeatureKeyOptXX=dialog(1)regDND(0)ua-profile(0:cfu(0)dnd(0)sf(0)hg(0))

```
[sys]
...
Current_Max_Multiline=2
FeatureKeyExt03 =S/<sip:2003>
FeatureKeyExt04 =S/<sip:2004>
FeatureKeyExt05 =S/<sip:2005>
FeatureKeyExt09 =S/<sip:2007>
FeatureKeyExt10 =S/<sip:2022>

FeatureKeyOpt03=dialog(1)regDND(1)ua-profile(0:cfu(0)dnd(0)sf(0)hg(0))
```

```

FeatureKeyOpt04=dialog(1)regDND(1)ua-profile(0:cfu(0)dnd(0)sf(0)hg(0))
FeatureKeyOpt05=dialog(0)regDND(0)ua-profile(1:cfu(1)dnd(1)sf(0)hg(0))
FeatureKeyOpt09=dialog(0)regDND(0)ua-profile(1:cfu(0)dnd(0)sf(1)hg(0))
FeatureKeyOpt10=dialog(0)regDND(0)ua-profile(1:cfu(0)dnd(0)sf(0)hg(1))
...
ServiceSupervisionStart=7
ServiceSupervisionOrder=CallFwd(1)DND(2)SecFilter(0)HuntGroup(0)
....

[sip]
....
CallFwdFlg=sc // StartCode for call forward (self phone)
CallFwdOffSC=*211*
CallFwdAlwaysSC=*21x*
DNDFlg=sc // StartCode for DND (self phone)
DNDOnSC=*31#
DNDOffSC=*32#
SFOnSV=*270x* // StartCode for SF (supervised phone)
SFOffSV=*271*
HGOnSV=*71x# // StartCode for HG (supervised phone)
HGOffSV=*70x#
...

```

Remark:

- The default sequence of ua-profile can be changed, like dnd(0)cfu(0)hg(0)sf(0)
- ua-profile value should be set to 1 in order to activate the services supervision.
- 0 for disable, default value; 1 for enable; any other value(except 0 or 1) or empty is considered as disable
- if duplicated, cfu(0)cfu(1)dns(0)sf(0)hg(0), the first one is valid.

Via Telnet:

Below shows some significant telnet commands for this case. For more information, please refer to *TB30S_Config File Syntax_V0034.pdf*.

1. Set the function key to be **Supervised line** with phone number

```
[administrator]# sys set fk 3 S/<sip :2003>
[OK] Set OK
```

2. Enable the line supervision and service supervision

```
[administrator]# sys show fk_blf_opt 3
Feature Key BLF Option[ 3] :dialog=Enable ; regDND= Disable ; ua-profile= Disable
[administrator]# sys show fk_blf_opt 3 1 0 0
```

4. Enter the starcodes flag with starcode

```
[administrator]# sip set DNDFlg sc
[OK] Set OK

[administrator]# sip set DNDOnSC *31#
[OK] Set OK

[administraotr]# sip set DNDOffSC *32#
[OK] Set OK
```

Comverse: Redirecting identity and name presentation

Currently, the TB30 do not support the "display-name" string of the Diversion header.

With working in Comverse environment, the feature of redirecting identity and name presentation allows its displays on the terminating phone. And the redirecting identity and name information is received on the initial INVITE request.

Therefore, this section is to address the implementation of the redirecting identity in TB30.

Let see the below example:

A (calling): 84000532 "Alice"

B (redirecting): 81000541 "Bob the Manager"

C (called): 84000531 "Assistant"

For a basic incoming call, TB30 will receive the following SIP INVITE message:

Initial INVITE from NETWORK received by C:

```
INVITE sip:84000531@10.165.2.31:5060 SIP/2.0
Via: SIP/2.0/UDP 10.165.2.200:5060;branch=z9hG4bK4901036f-6756-5198
Call-Id: CI_375_84000531_120
From: "Alice" <sip:84000532@10.165.2.200:5060>;tag=10.165.2.200-6745-8537
To: <sip:84000531@10.165.2.31:5060>
Max-Forwards: 70
Allow: REGISTER, INVITE, BYE, ACK, CANCEL, REFER, INFO, OPTIONS, SUBSCRIBE
Session-Expires: 120
CSeq: 375 INVITE
Contact: <sip:84000532@10.165.2.200:5060>
Supported: timer
Diversion: "Bob the Manager" <sip:81000541@10.165.2.200:5060>
Content-Type: application/sdp
Content-Length: 217

SDP
```

There are three states need to be considered:

1. In Ringing (During call incoming) state

TB30 display the Caller and the Redirecting name alternatively on the screen, and the redirecting name will be displayed in reverse video. The time interval for the swap will be in 1 second.

If the diversion header has Redirecting party Name, phone should display "Bob the Manager", but if it doesn't have Redirecting party Name, phone should display Number "81000541".

2. In Talking state:

TB30 display the Caller name with number.

3. In Call log:

The call log list shows the detail of caller information.

Remark:

If the phone number of "Bob the manager" is saved in phone book, the display should show the name in the phone book.

Only top header is showed.

Feature Activation

Via APS:

A new parameter will be introduced to activate/deactivate the feature of redirecting identity and name presentation in [sip] section of both Common and Specific-MAC config files.

DiversionHeaderFlag= <0|1> ,

Where, 0 is disable (default setting),
 1 is enable

```
[sip]
....
DiversionHeaderFlag =0           // by default, disable
DiversionHeaderFlag =1           // Diversion header is supported
.....
```

Via Telnet

To configure, open a command line console, and telnet the phone.

Multi-registration on a same server

TB30 is able to support multi-registration on the same server. The main line is the master.

“**Registered**” status icon will be driven by the main line registration status. Function key 1 will always be assigned to the main line. Multi registration can include Main line.

The phone behaviour will be the same for the main line and other registered lines for all features including register.

The phone supports multi-registration so that each line will register with server with different credential and extension number.

This document addresses the improvements to be done in TB30 to enhance its support for this feature.

Feature Activation

A new parameter is needed to configure this function and with some additional definitions listed below.

Via the web GUI:

An additional item will be created in the roll down “Type” menu: **Multi-registration**. This roll down type will always be shown.

The function key assigned to multi-registration will have the following parameters separated by “|” (vertical bar):

- Line number
- Authentication username
- SIP password
- Phone Name (Optional)

Via APS:

APS in [sys] section of both Common or Specific-MAC config files with the new Parameter:

M will be used to denote the option for multi-registration, like below:

```
[sys]
.....
Current_Max_Multiline=5    (available overall number of Multit-registration line is Multiline-1)

FeatureKeyExt02=M/:<sip:2001|username|password|PhoneName2001>
FeatureKeyExt03=M/:<sip:2002|username|password|PhoneName2002>
FeatureKeyExt04=M/:<sip:2003|username|password|PhoneName2003>
.....
```

Via Telnet

To configure, open a command line console, and telnet the phone.

Support Private Number

Our customer’s architecture includes a private identifier (called “**pn**”) in the INVITE message in order to notify the end-user with a more legible number notification.

For this purpose, a new parameter has been included in section [sip] of common or MAC config files in each profile.

Remark:

use_PrivateNumber=0 (default)

New policy:

If header to be used for incoming call identity display (depending on CLIPPriorDisplay and received headers) contains an uri like this:

header: <sip:<number>;pn=<privatenumber>@<hostpart>,

then

- if use_PrivateNumber is set to 0 (default),
 - show and store in Call log <number>@<hostpart> , as current behaviour
- if use_PrivateNumber is set to 1,
 - show <privatenumber> in incoming call and talking screen
 - show <privatenumber> in call log,
 - store the full <user part>@<hostpart>, in call log, for dialing purposes

Feature Activation

A) Through APS:

In Common or Mac Config file, user can set enable or disable the use of private number to 0 or 1 respectively. Default value is 0

```
[sip]
...
use_PrivateNumber=0 (default)
use_PrivateNumber=1 (Notify the end-user with a more legible number)
...
```

B) Through Telnet:

To configure, open a command line console, and telnet the phone.

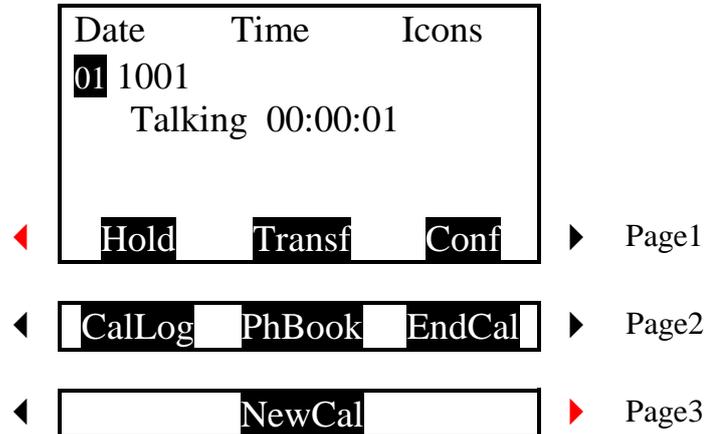

Softkey left scrolling in talking mode

In order to improve the MMI and have the same behaviour between idle mode and talking mode, the navigation thru the soft keys has to be changed

Add left arrow on Page1 allowing direct jump to Page3

Add right arrow on Page3 allowing direct jump to Page1

Feature Activation

This is always active.

Incoming Call during transfer

When users try to transfer a call and receive a call at that moment, the transfer shall not be cancelled.

The incoming call shall be placed in the queue on the first available line (Line 2, Line 3 ...) or rejected if no more free line is available, and it also shall not disturb the transfer process.

However, for blind transfer a mechanism needs to be provided to answer incoming calls once the transfer has been launched.

Thus, this section addresses the improvements on Attended transfer and blind transfer of TB30s and provides a number of call flows for your reference.

Attended Transfer

When an incoming call arrives, it is automatically placed on the first available line. Depending on whether the 2nd call has been already initiated or not yet, the display shows the incoming call on the screen.

To make the implementation easier, if the user presses "C" key, the display will return to the "Transfer" screen to allow the user to resume the on going transfer.

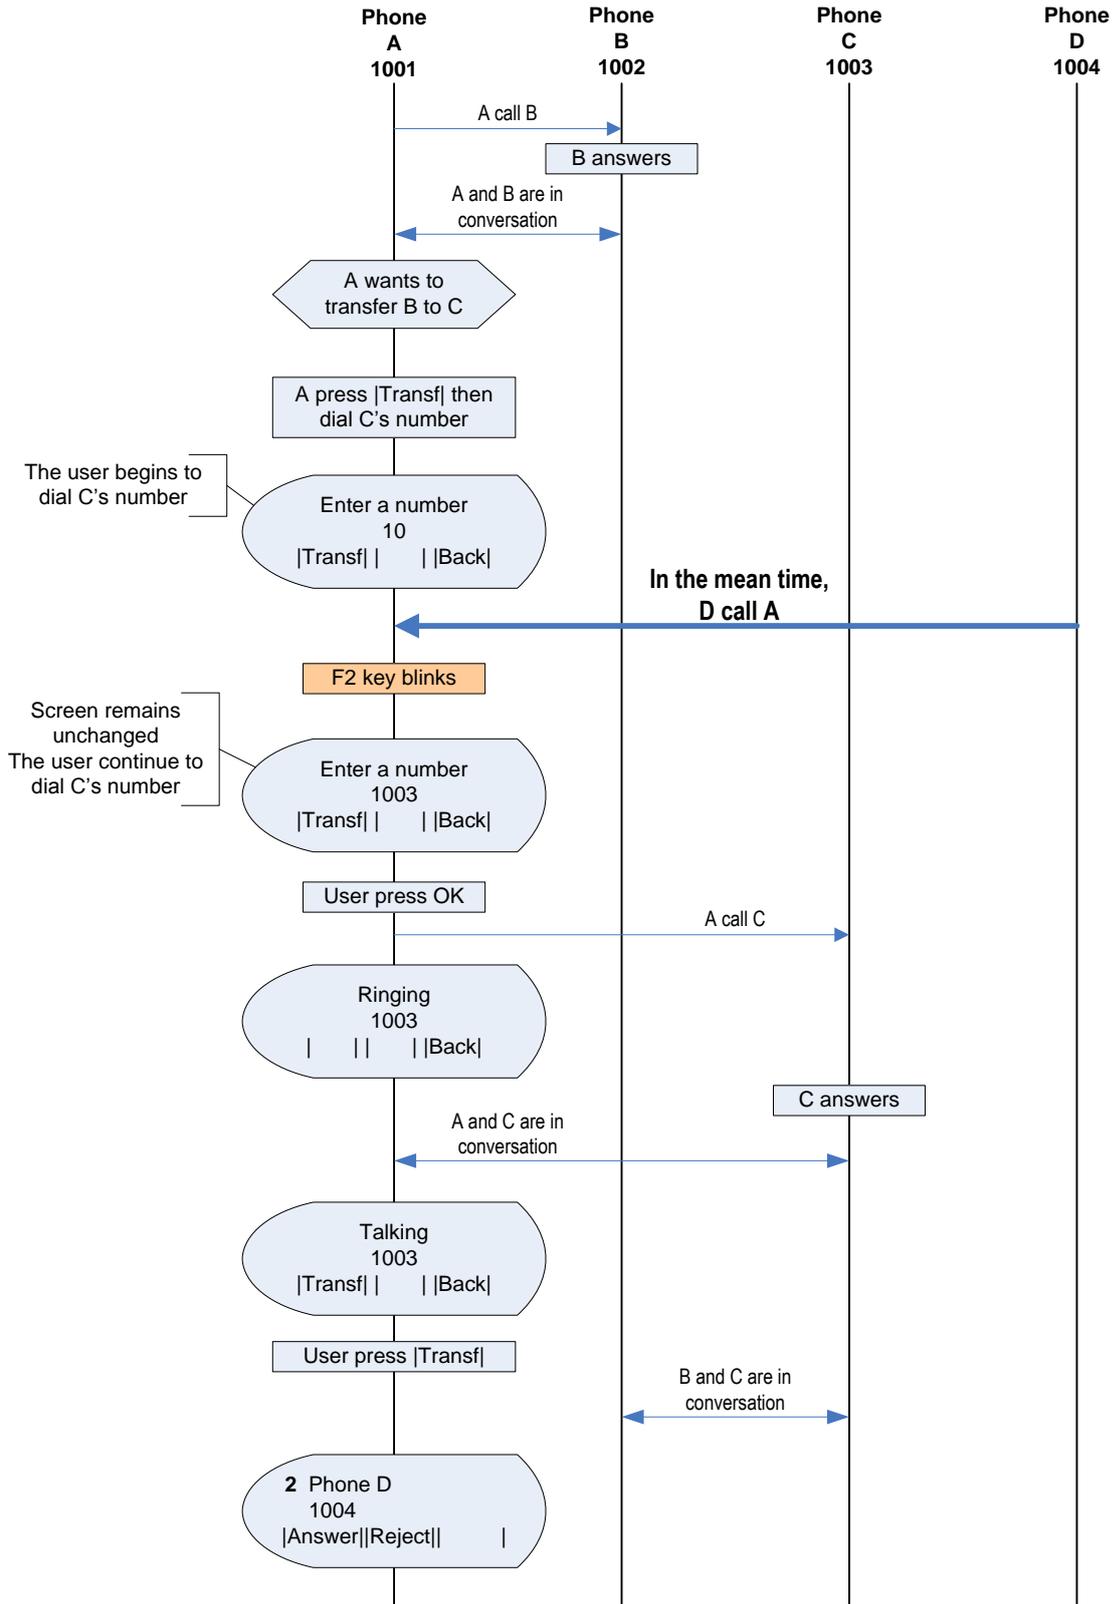

Once the transfer finished, the phone will show back to the incoming call screen. Then the user can answer to the 2nd call.

Remarks:

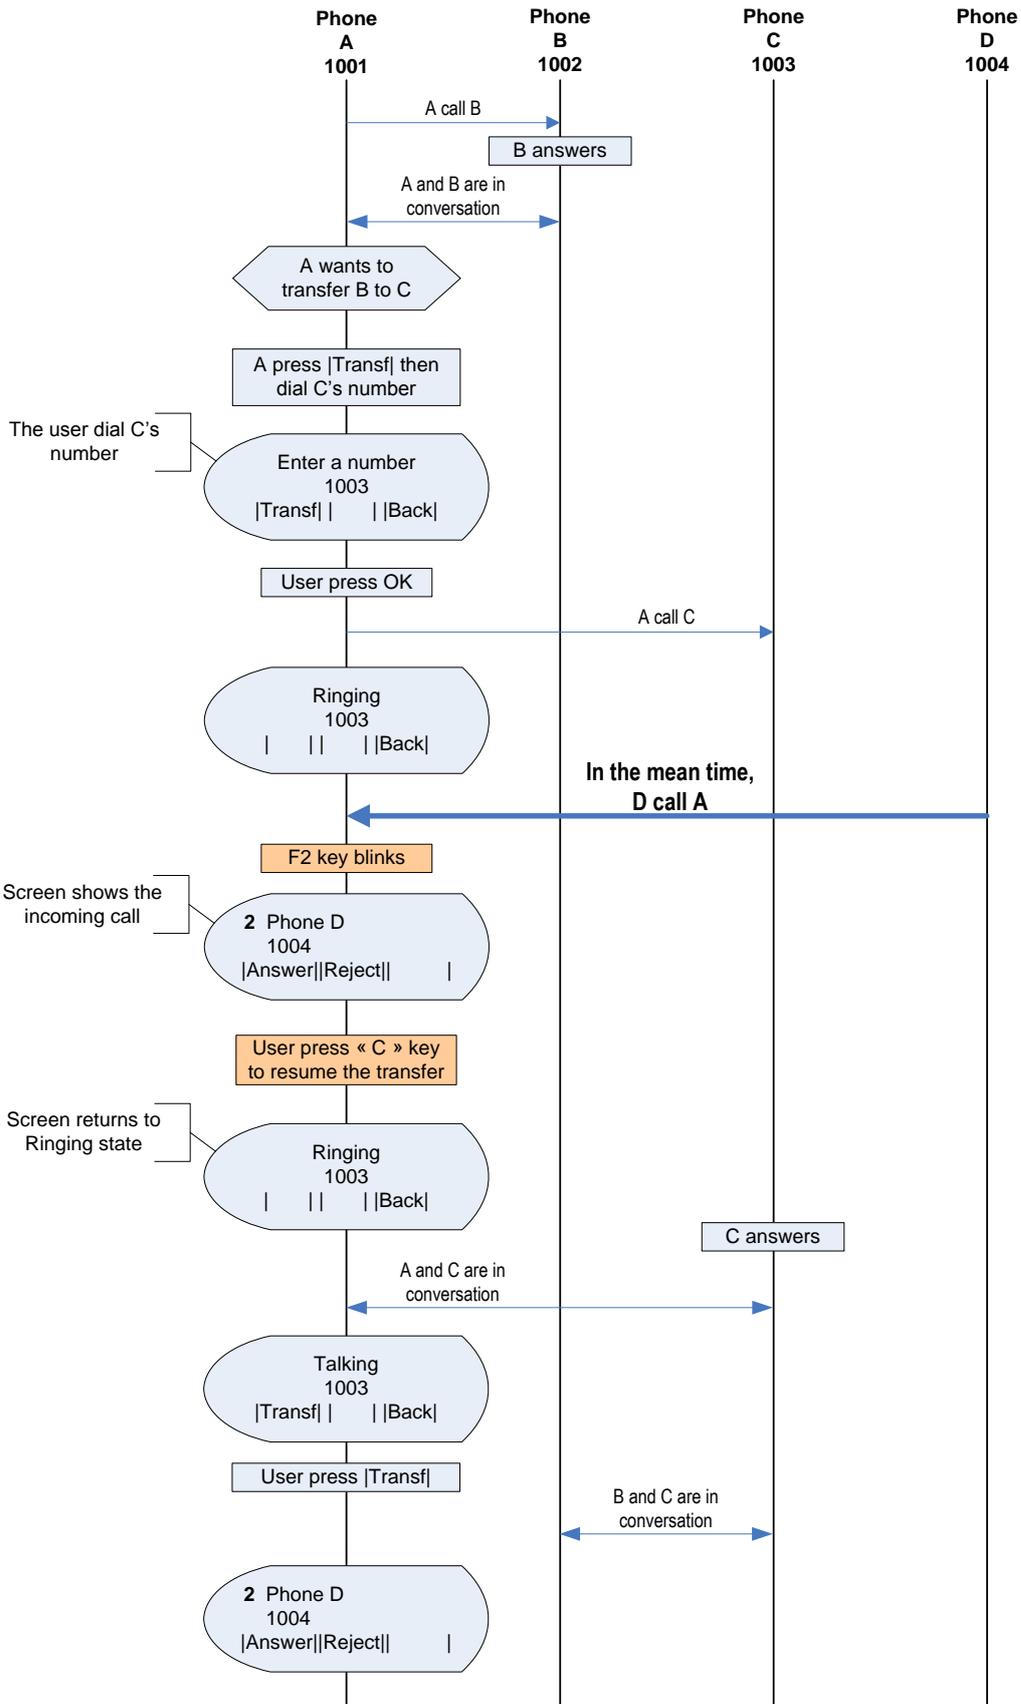

In the call flows, the following cases are not shown. As it is assumed the following behaviour is acceptable as it is and do not need to be modified.

- if user A answers the call from D, in fact the transfer is cancelled; A keeps the call with B only with B held
- if user A rejects the call from D, transfer screen is resumed

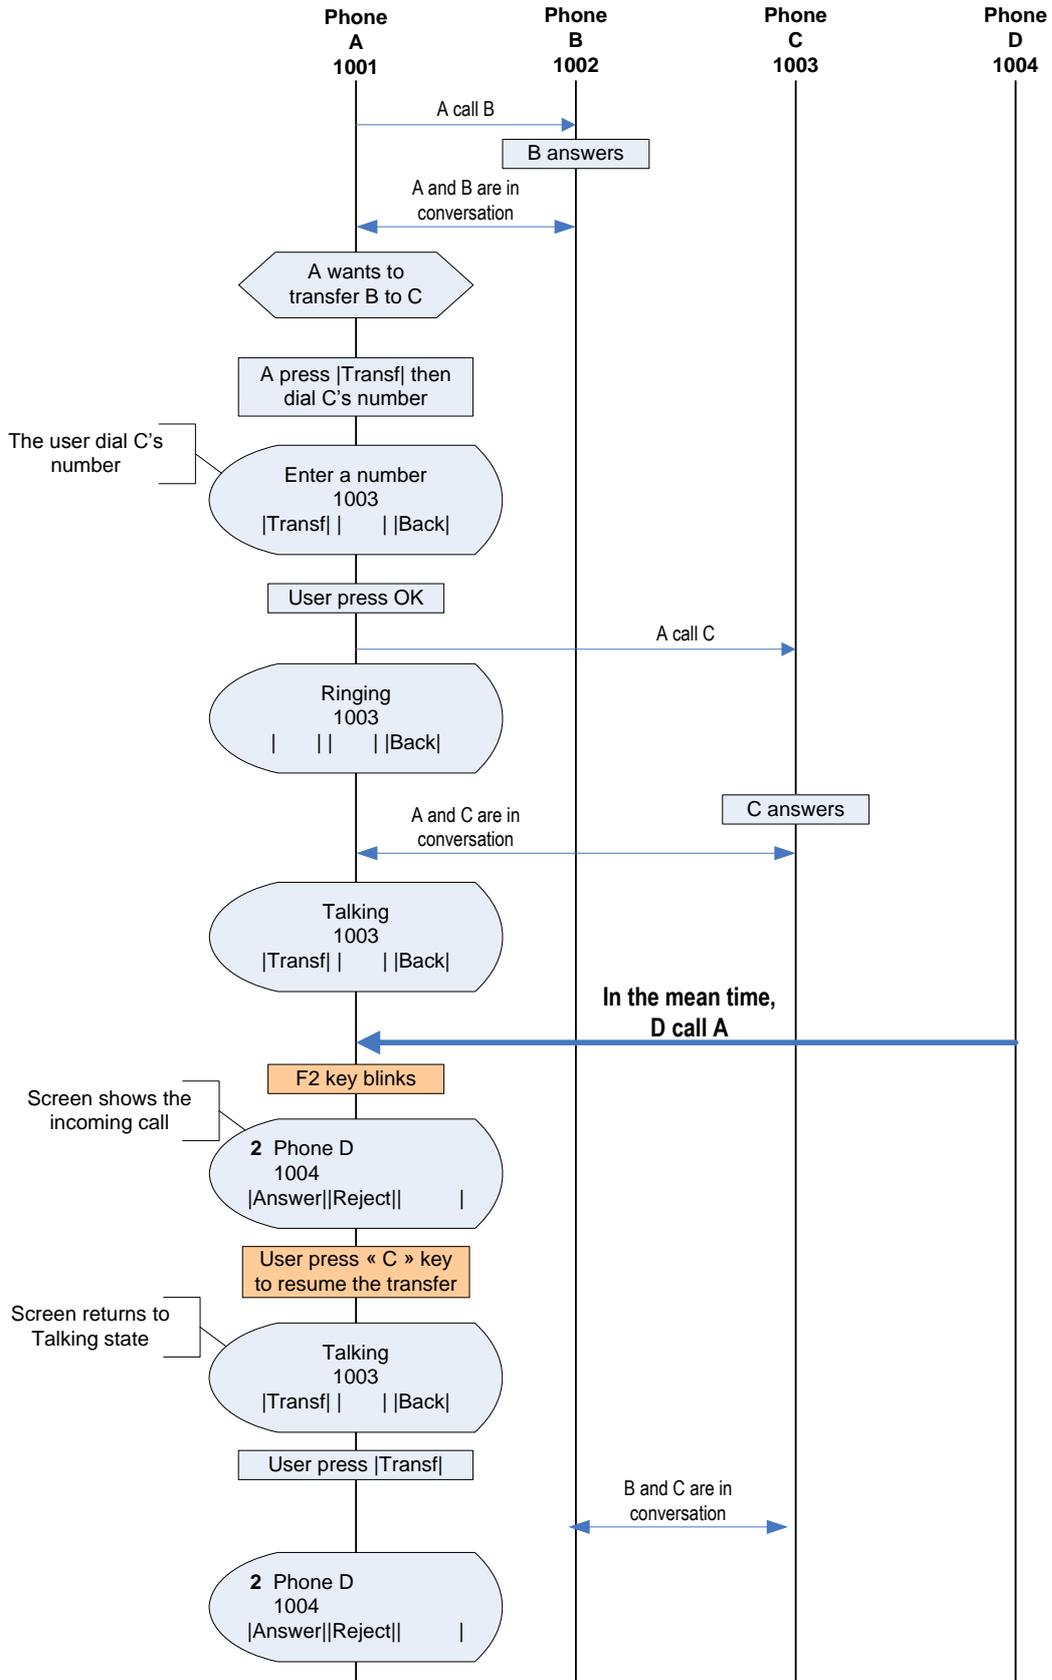

Call flow 1:

Call flow 2:

Call flow 3:

Blind Transfer

When the user initiates a blind transfer, the phone launches a “recovery timer”. This timer ends if the 2nd correspondent answers and transfer is then completed or if first dialog is recovered due to failure in the transfer or timer expiration.

During this timer, in current implementation the transfer is not able to answer to any incoming call, which is not a desirable behaviour in many environments.

When an incoming call arrives, it is automatically placed on the first available line. If the user press “C” key, an early BYE shall be sent to end the dialog with the 1st correspondent.

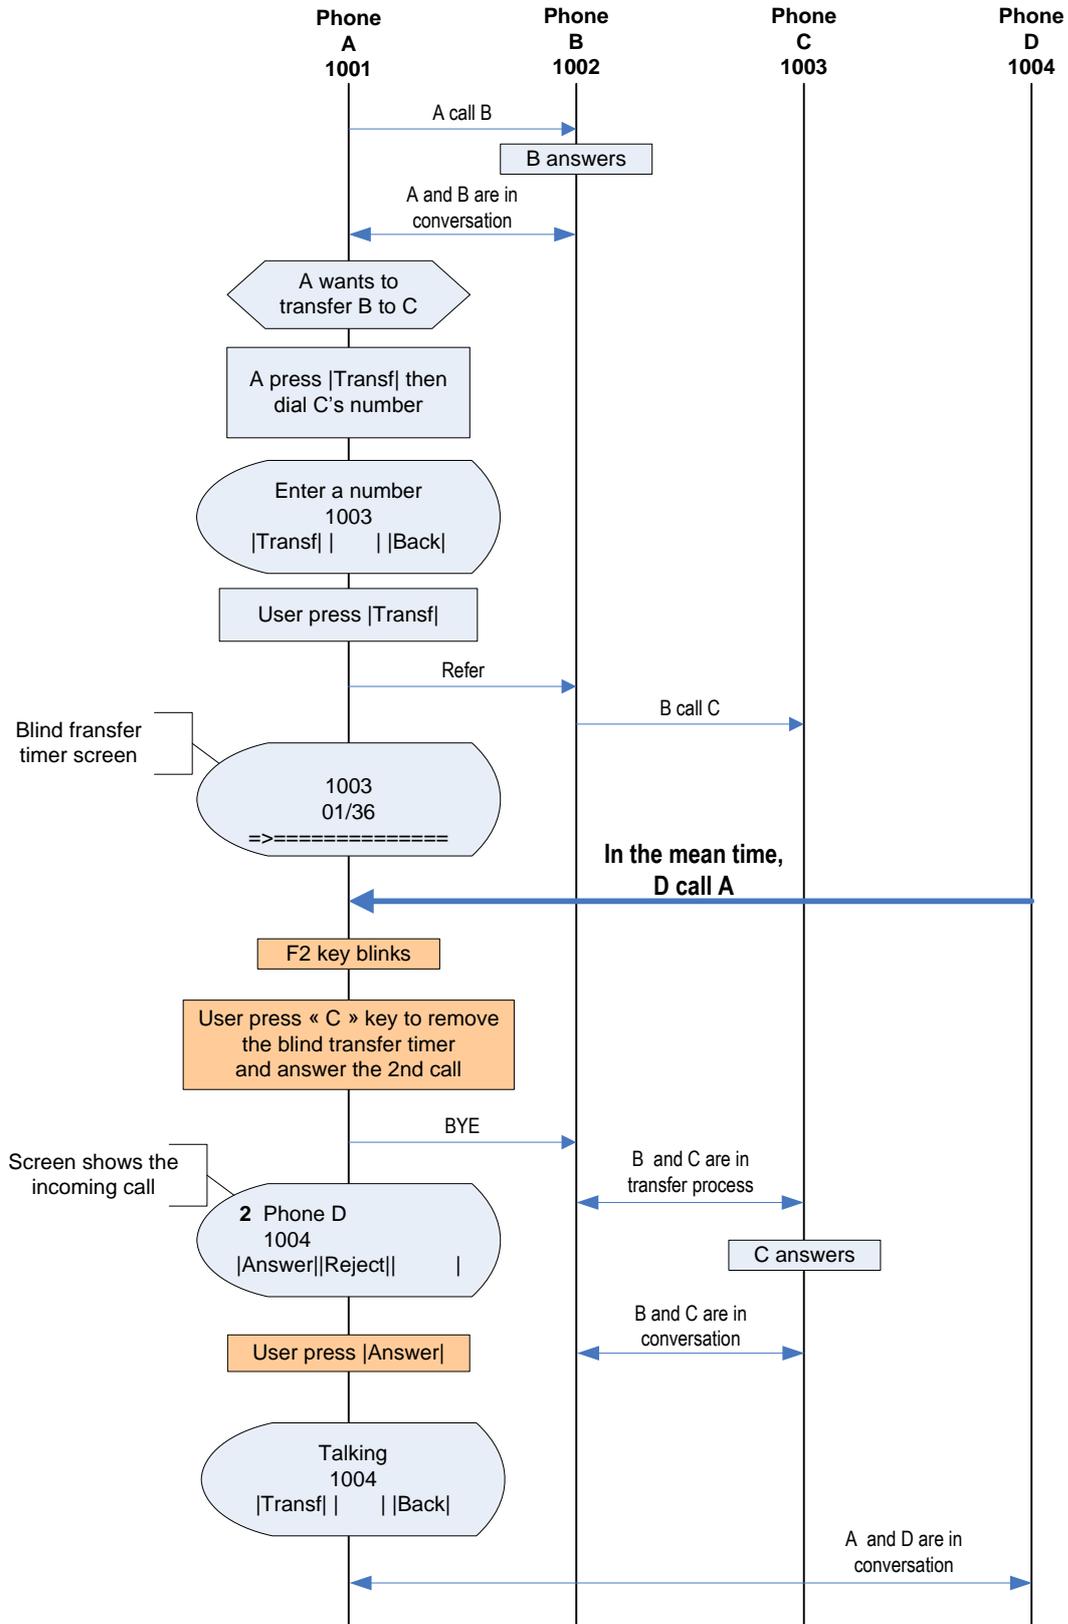

Now, the early BYE must be sent only after the transferee has accepted the REFER to avoid to cancel the on-going transfer.

Doing that, it is assumed there’s no way to recover the 1st call if, for any reason, the transfer fails.

The display will show the incoming call screen. Then the user can answer to the 2nd call

See example below:

Call flow 4:

Number display in Standby

TB30s is able to show a different number in standby than the one used for registration. For this purpose, two new parameters have been included in section [sip] of common or MAC config files in each profile.

DisplayNumFlag value is disabled by default

DisplayNum could be any char. The maximum number of digits is 20. It shall not replace any parameter of the sip profile (display name, phone number, auth name), it's only affecting the displayed info on the screen.

The default setting would be:

DisplayNumFlagX=0 , where X is profile 1,2,3,4
 DisplayNumX=

Example:

DisplayNumFlag1=1
 DisplayNum1=2001

On profile 1, the option of number display is enable. As a result, the 2001 will be used and replaced the default telephone number displaying on the phone screen.

Remark:

Hide_Phone_Number_Display have priority over DisplayNumFlagX.
 Hide_Phone_Number_Display=1 and DisplayNumFlagX =1. Number is Not Show in standby.
 "DisplayName" is still shown on the screen and in the same position, independently of DisplayNumFlagX and DisplayNumX value.

Feature Activation

A) Through APS:

In Common or Mac Config file, user is enable or disable the number display flag to 0 or 1 respectively. Default value is 0.

```
[sip]
...
DisplayNumFlag1=0 (Default telephone number will be used and displayed on screen)
DisplayNumFlag2=0
DisplayNumFlag3=0
DisplayNumFlag4=1 (DisplayNum will be used and replace the default number displaying on
the screen)
DisplayNum1=
DisplayNum2=
DisplayNum3=
DisplayNum4=2001 (max digits is 20)
...
```

B) Through Telnet:

To configure, open a command line console, and telnet the phone:

Improved Shared Call Appearance (SCA)

TB30 supports SCA according to Broadsoft R14 specification. However, due to its single line architecture, which only allows 1 SIP account active at a time.

This section addresses the improvements had be done in TB30 to enhance its support for this feature and its application developed for Broadworks R14 only.

Improvements

1. The phone supports "multi-lines" so that each line will register with the Broadsoft server with different credential and extension number. Registrar will see several registrations. Main line will be the master, and will determine most of the available services.
2. Multiple phones in the shared appearance group will be provisioned with the same "multi-lines" configured on each, and the only difference between the phones is that each phone will have a different extension number configured as its primary line (line 1 for example).

The primary extension number of any phone will be configured as a "secondary" extension in all other phones. Phone provisioning system allows doing so, but admin has to decide how many lines and how many appearances per line to provide, and generate the appropriate configuration data. Function Key 1 will always correspond to the main line. Available overall number of SCA's is Multiline-1.

3. Each phone should be able to display the status of all other lines as in standard BLF. It is important to make clear we are talking about SCA in this document, and not about BLF. BLF in Broadsoft is only supported in R13 and beyond, and its implementation and behaviour is different from Asterisk BLF.

However, SCA framework does include subscriber notification status for each shared call appearance via Call-Info: idle, seized, progressing, alerting, active, held, held=private, bridge-active, bridge-held in R14.

4. Incoming call alerting in idle state:

When a call comes in to the primary line of a phone, Broadworks sends INVITE to ALL SHARED CALL APPEAREANCES. Hence, all phones sharing the same line will ring when a call is received in idle state. Phones will indicate the incoming call also in the Function Key's LED which corresponds to that appearance.

5. Behavior when an incoming call is received and another one is active:

In the event that additional call arrives when the user is already engaged in a call, the phone should provide call waiting indicator. Calls to other lines (than primary line) should be indicated with on-screen display and Function Keys LEDs, with the same approach as above: function key led which corresponds to that appearance is the one to be used.

6. Main Line can be share or private:
 - Phone can have on main private line with Second line: Private Main line is not Share with any others phones.

- Phone can have on main Share line with Second line: Share Main line is share with others phones.

Feature Activation

To activate shared call Appearance with Main line private, a new parameter has created, described as follow:

New Parameter : SCAMainLinePrivate
Existing Parameter : SharedCall Appearance

A) Through WebGui:

The activation of this feature is accessible from the web GUI in the Advanced → Call Feature. Then, enable Broadsoft’s SCA or Broadsoft’s SCA with SCA Main Line Private. (Shared Call Appearance is disable by default)

Then, you have to set the Multiline (available overall number of SCA’s is Multiline-1), in Advanced → Advanced.

Function Key 1 will always correspond to the main line.

hen go to Advanced → Call feature → Function Key table. An additional item will be created in the roll down “Type” menu: Broadsoft SCA. This roll down type will be shown when existing SharedCallAppearance=1 (Broadsoft SCA)

The function key assigned to an SCA will have the following parameters separated by “|” (vertical bar):

- Line number
- Authentication username
- SIP password

B) Through APS:

APS in [sip] section of both Common or Specific-MAC config files with the new Parameter:

- SharedCallAppearance= 0 (0 by default, inactive; 1 to active)
- SCAMainLinePrivate= 0 (0:default, 1: Main line is private, this flag only take effect with SharedCall Appearance=1)

```
[sip]
...
SharedCallAppearance= <0|1> (0 by default, inactive; 1 to active)
SCAMainLinePrivate=<0|1> (0: default, main line is also shared; 1: Main line is private
and will not perform any of the Broadsoft SCA procedures)
...
[sys]
Current_Max_Multiline=4 (available overall number of SCA’s is Multiline-1)
FeatureKeyExt03=A/:<sip:2408881411_1|username|password>
FeatureKeyExt04=A/:<sip:2408881413_1|username|password>
...
```

C) Through Telnet:

To configure, open a command line console, and telnet the phone:

Second dial-tone for PBX-like environments.

This new feature specifies how to simulate the behavior of an analog phone or a “proprietary phone” which is connected behind a PBX.

TB30 can now generate another dial tone when the user dials the specific PBX prefix.

As you can see in the dumped “ToneTbl.zz” file, the phone can support 3 kinds of dial tones : <Dial-Tone>, <Dial-Tone2> and <Dial-Tone3>.

<Dial-Tone> and <Dial-Tone2> from the internal ThomsonToneTable will be used to configure the tones we want to play.

```

<ThomsonToneTable>
  <Country-TableName>PBX</Country-TableName>
  ...
  <Dial-Tone>
    <Num-of-Element>1</Num-of-Element>
    <Tone-Element-1>
      <Num-of-Tones>2</Num-of-Tones>
      <Freq-1>350</Freq-1>
      <Amp-1>-130</Amp-1>
      <Freq-2>440</Freq-2>
      <Amp-2>-130</Amp-2>
      <Duration>Forever</Duration>
    </Tone-Element-1>
  </Dial-Tone>

  <Dial-Tone2>
    <Num-of-Element>1</Num-of-Element>
    <Tone-Element-1>
      <Num-of-Tones>2</Num-of-Tones>
      <Freq-1>250</Freq-1>
      <Amp-1>-130</Amp-1>
      <Freq-2>250</Freq-2>
      <Amp-2>-130</Amp-2>
      <Duration>Forever</Duration>
    </Tone-Element-1>
  </Dial-Tone2>
  ...
</ThomsonToneTable>

```

Two new parameters have been created to support this new feature:

1. PBXconfiguration , to indicate if the phone is behind a PBX or not.

<Dial-Tone> will be played first when user goes off hook (as it was already the case until this version), no matter the value of this parameter. So, if this parameter is set to 1 (behind PBX), you should modify the <Dial-Tone> table and configure it with your preferred PBX dial-tone.

2. PBXprefix, to indicate which is the PBX-prefix to access to the public network (can be 0 to 9, * or #). If the phone is not behind a PBX (previous parameter set to 0), this second parameter will not be taken into account.

If the phone is behind a PBX, the behavior of the phone is as follows:

- When the user takes the line, <Dial-Tone> is generated.
- When the user enters the 1st digit:
 - If this (digit = PBXprefix) then <Dial-Tone2> is played until another key is pressed
 - In any other case, <Dial-Tone> is stopped, as current behavior.

Feature Activation

A) Through the WebGui:

The activation of this feature is accessible from the WebGui in the Advanced → Dial Plan section.

B) Through APS:

For this purpose, two new parameters have been included in the [sys] section of the Common/MAC config files, to be able to activate the configuration of the second dial tone behind a PBX.

```
[sys]
...
PBXconfiguration=1
PBXprefix=0
```

The parameter “**PBXconfiguration**” could be either 0: normal behaviour, 1: phone behind a PBX. The default value is “0”.

The parameter “**PBXprefix**” could be either 0 to 9, * or #.

C) Through Telnet:

For this purpose, two new parameters have been created, described as follow:

```
sys set PBXconfiguration (0: default setting    1: phone behind a PBX)
sys set PBXprefix      (0 to 9, * or #)
```

To configure, open a command line console, and telnet the phone:

New specific keys in the Dial Plan.

The following DigitMap syntax definition was used by TB30 to define when the phone has to stop collecting digits and initiate a call in off hook mode:

Dial Plan
Dial plan can be configured with following characters :
Digit: A Digit from "0" to "9".
Timer: The symbol "T" matching a timer expiry.
Wildcard: The symbol "x" which matches any digit ("0" to "9").
Position: A period (",") which matches an arbitrary number, including zero, of occurrences of the preceding construct.
Range: One or more DTMF symbols enclosed between square brackets("[and "]").
Subrange: Two digits separated by hyphen ("-") which matches any digit between and including the two. The subrange construct can only be used inside a range construct, i.e., between "[" and "]".
Or: Add more dial rule with " ".

However it does not cover the specific functions on server side (controlled by n-digits star codes) like enable or disable access voice mail server, enable or disable voice recording, etc which often include "*" and "#".

Thus, TB30 now implements specific keys "*" and "#" in the existing dial plan in order to enable/disable these specific functions.

Note that wildcard "x" does not include "*" or "#".

For example:

```
(0T|00T|[1-7]xxx|8xxxxxxxx|#xxxxxxxx|*xx|91xxxxxxxxxxxx|9011x.T)
```

More examples:

"****": If dialed number exactly matches 4 "star" digits, then we send it to server.

"*xxx" : If dialed number exactly matches 4 digits and the first digit is "*", then we send it to server.

"*xxxT" : If dialed number exactly matches 4 digits and the first digit is "*", then we send it to server till timeout.

"####": If dialed number exactly matches 4 "hash" digits, then we send it to server.

"#xxx": If dialed number exactly matches 4 digits and the first digit is "#", then we send it to server.

"*xx#": If dialed number exactly matches 4 digits and the first digit is "*" and last digit is "#", then we send it to server.

Feature Activation

A) Through the WebGui:

B) Through APS:

For this purpose, you have to use the following APS parameters:

```
[sys]
...
EmergencyDialPlan=|911|11x|1[2-8]|
VOIPDialPlan=(0T|00T|[1-7]xxx|8xxxxxxxx|#xxxxxxx|*xx|91xxxxxxxxxxxx|9011x.T)
```

C) Through Telnet:

For this purpose, you have to use the following telnet parameters (already existing in previous versions):

```
sip set voip_dialplan (dialplan_string(max:120chars))
sys set emg_dialplan (dialplan_string(max:120chars))
```

To configure, open a command line console, and telnet the phone:

New error message display for 403 response.

When the user dials a number that is not authorized on a network, it receives a 403 Forbidden message.

On current implementation, when the phone receives a 403 Forbidden message, it displays "Dialing Failed!".

This message could be misinterpreted by the end user who will try several times and finally call the administrator.

To enhance the MMI and reduce the need of support from customers, when the phone receives a "403 Forbidden" message, it shall display "Forbidden" which is a more appropriate message.

Additional strings in the language table:

Error Message	English	French	Spanish	German	Italian
Forbidden	Forbidden	Interdit	Prohibido	Verboten	Proibito

Error Message	Norway	Russian	Portuguese	Netherlands	
Forbidden	Forbudt	Запрещено	Proibido	Verboden	

Feature Activation

This feature is always active.

Services Supervision Feature.

This feature describes how TB30 can request for a user profile and receive notifications related to a set of services implemented by the network like:

- DND activation status
- Call Forward activation status
- etc....

A few comments first. SIP User Agents require configuration data to function properly. A configuration data set, specific to an entity, is termed a profile. Process to get this profile could be automatic with no user intervention. In our scope, Service variables supervision is performed using the [User Profile](#).

So, to support this new feature, TB30 has implemented the "ua-profile" Event Package as described in "draft-ietf-sipping-config-framework-xx.txt". This framework provides a standard means of providing dynamic configuration and also addresses change notifications when profiles change. The content or format of the profile will be defined below.

There are 3 stages for the profile delivery process: enrollment, content retrieval and change notification. The behaviour of the phone in each state is as follows:

A) Enrollment: TB30 requests and receives its profile data.

After a successful registration process, TB30 will generate an initial SUBSCRIBE request for the event package "ua-profile" to the SIP server in order to be notified for the state of subscribed services for this account. The initial SUBSCRIBE Request-URI, To and From headers are set to the account, and includes an Event and Accept headers as follows:

```
SUBSCRIBE sip:2205@10.0.0.5:5060;user=phone SIP/2.0
Via: SIP/2.0/UDP 10.0.0.55:5060;branch=z9hG4bK4696915359658109209-910168
From: <sip:2205@10.0.0.5:5060>;tag=c0a80101-de357
To: <sip:2205@10.0.0.5:5060>
Call-ID: e32b4-c0a80101-d-3@10.0.0.55
CSeq: 1 SUBSCRIBE
Max-Forwards: 70
Event: ua-profile;profile-type=user
Accept: application/service-user-profile+xml
Expires: 3600
Contact: <sip:2205@10.0.0.55:5060;user=phone>
Allow-Events: refer,dialog,message-summary,check-sync,talk,hold
User-Agent: THOMSON TB30 hw0 fw1.62 00-0E-50-4E-88-E0
Content-Length: 0
```

Then, SIP Server receives successfully this Subscribe and identifies the requested profile data. It prepares a SIP NOTIFY message to TB30 with the ua profile data inserted inside the body, and sends it immediately to complete the enrollment.

B) Content Retrieval

A successful profile enrollment leads to an initial SIP notification, and may result in subsequent change notifications. Each of these notifications can contain a profile data with the following restrictions:

The NOTIFY content is set according to the MIME type "`application/service-user-profile+xml`". All service variables are described in a XML document.

Inside the XML `<service>` node, each service variable is configured with a dedicated `<variable>` node. The `<variable>` node provides service variable name and current value.

For example:

```
NOTIFY sip:2205@10.0.0.55:5060;user=phone SIP/2.0
Via: SIP/2.0/UDP 10.0.0.5:5060;branch=z9hG4bK-b7d60ea12c0761993d006bb99033562e
from: <sip:2205@10.0.0.5:5060>;tag=e9c388b8d46
to: <sip:2205@10.0.0.5:5060>;tag=c0a80101-2834
Call-ID: 4fb8-c0a80101-d-2@10.0.0.55
CSeq: 2 NOTIFY
Contact: <sip:script@10.0.0.5:5060;transport=UDP>
Max-Forwards: 70
Subscription-state: active
Content-Length: 274
Event: ua-profile;profile-type=user
Content-type: application/service-user-profile+xml

<?xml version="1.0" encoding="UTF-8"?>
<service>
<variable name="cfu_on" value="1" />
<variable name="dnd" value="0" />
</service>
```

Following services are defined for TB30 at this point:

Name	Possible values	Description
cfu_on	Integer: { 0, 1 }	Activation state of the Unconditional Call Forward. 0 means deactivated. 1 means activated.
sf_on	Integer: { 0, 1 }	Activation state of the Secretarial Filtering feature. Applicable only when a Manager line is supervised. 0 means deactivated. 1 means activated.
dnd	Integer: { 0, 1 }	Activation state of the Do Not Disturb feature. 0 means deactivated. 1 means activated.
hg_rdy	Integer: { 0, 1 }	Indicates whether the CPE that initiated the supervision is ready on the supervised Hunt Group. Applicable only when a Hunting Group virtual line is supervised. 0 means not ready. 1 means ready.

When TB30 receives the SIP NOTIFY message, indicating successful profile enrollment, it makes it effective immediately and displays service status to the user.

The duration of the subscription is 3600 by default.

C) Change Notification

Each time service configuration changes, the SIP server sends a NOTIFY message to communicate the updated service variables to the TB30. The NOTIFY body directly contains the new profile data.

The NOTIFY request content is set as described above and will only provide the updated service variables.

For all other service variables, the previous received values still apply.

TB30 will apply the updated service variables and display them to the user according with MMI NOTIFICATION section below:

MMI Notification

One function key will be affected to each service. Depending on the state of the service, the corresponding function key's LED will be turned ON or OFF.

The Function Keys affected to a Service Supervision will remain inactive if the user presses them.

Things to know :

- Service Supervision will coexist with User-oriented BLF, but NOT with List-oriented BLF.
- To simplify the implementation, function keys assigned to Service supervision will follow each other. So there will be a block of max 4 function keys.
- The position of the first function key and the order of the keys will be defined with two new different parameters.
- If within the range allowed to Service Supervision there's already a function key assigned to an extension number or a supervised line, this key could be skipped or simply erased.
- Once a function key is assigned to Service Supervision, it cannot be modifiable through the MMI nor the web GUI.

Feature Activation

A) Through the WebGui:

This feature can not be configured through the Web (as mention above). However you can check the configuration through Advanced – Call Feature – Function Key Table :

B) Through APS:

For this purpose, two new parameters have been included in the [sys] section of the Common/MAC config files, to be able to activate the feature.

```
[sys]
...
ServiceSupervisionFK=0
ServiceSupOrder=callfwd(0)dnd(0)secFilter(0)huntgroup(0)
...
```

The parameter "ServiceSupervisionFK" could be a value from Multiline+1 (default) to max number of function keys available (10, 38 or 66 if using extension modules).

The parameter "ServiceSupOrder=callfwd(a)dnd(b)secFilter(c)huntgroup(d)" could have the following values, where a, b, c, d values can be 0, 1, 2, 3 or 4:

- 0 means the function is not supervised.
- the other values are the order of the function key affected to this service.

CallFwd is linked to "cfu_on" variable
 DND is linked to "dnd" variable
 SecFilter is linked to "sf_on" variable
 HuntGroup is linked to "hg_rdy" variable

For example:

```
[sys]
Current_Max_Multiline=5
ServiceSupervisionFK=7
ServiceSupOrder=callfwd(2)dnd(1)secFilter(0)huntgroup(0)
```

Here,

- Call Forward service will be supervised on function key 8.
- Do Not Disturb service will be supervised on function key 7.
- Secretarial Filtering will not be supervised at all.
- Hunting Group will not be supervised at all.

So, function keys 6, 9 and 10 could be assigned to anything else.

C) Through Telnet:

For this purpose, two new parameters have been created, described as follow:

```
sys set ServiceSupervisionStart [id]

sys set ServiceSupervisionOrder <CallFwd> <DND> <SecFilter> <HuntGroup>
(Value: 0~4,)
```

To configure, open a command line console, and telnet the phone:

Star Codes.

Star Codes (SC) or Feature Access Codes (FAC) are special char or digity patterns that are dialed from a phone to invoke particular server features.

Typically, FAC are invoked using a short sequence of digits that are dialed using the keypad on an analog phone, while IP phones users select soft-keys to invoke the same features. Generally speaking service will be invoked by sending an INVITE to a specific uri which contains the FAC.

A description of how to change the TB30 local soft-keys configuration to activate/deactivate these features instead of the local functions, and instructions on how to use each of them is provided in the following chapters.

A special case takes place when a FAC has to be sent as DTMF during an existing SIP call. For this purpose, a specific type of function key is defined and described in chapter 6.9

Also, for other potential services invoked by FAC's and not supported by softkeys, a "Service" type of function key is defined and described in chapter 6.10.

Things to know :

1.- For each local function, a flag is used to state if the function is managed locally (as current behavior) or using the star codes. For those items which have a "local/sc" flag, whenever the flag is set to "local", the behavior will be the same as it is today. So chapters below refer only to the flag="sc" value when applicable.

2.- When function flags are set to "sc" for features launching some kind of icon or message on the display (CF, DND...), then this indication will not be present, in order to avoid un-synchronization with server state. Better not to provide any state than a wrong one!

3.- A "Star Code" can include keypad digits (0-9, * and #), as well as any chars allowed in uri's. For DTMF function key type only keypad digits are allowed.

4.- For functions related to call forward, if sc is enabled, we need to use a different call to send the sc. It is assumed the server is in charge of canceling the initial call being forwarded.

5.- When a star code is sent and there is an active call, active call is put on hold

Glossary: SC= star code; FK= function key

Call Pick-Up Service

Feature Activation

A) Through the WebGui:

The activation of this feature is accessible from the WebGui in the Advanced → Call Feature section.

B) Through APS:

For this purpose, two new parameters have been included in the [sip] section of the Common/MAC config files, to be able to configure the feature.

```
[sip]
CallPkupFlg=sc
CallPkupSC=*53
```

C) Through Telnet:

For this purpose, two new parameters have been created:

```
sip set CallPkupFlg [local|sc]
sip set CallPkupSC (call pickup star code)
```

Behavior

Call pick-up with Soft Key

1. Press Pick-Up soft key.
2. The phone will display "Enter a number".
3. Then, user will enter the extension number to be picked up.
4. The phone will send the INVITE with TO header set to "SC + phoneNr"

Call pick-up with Function Key (User oriented BLF)

1. Press FK when blinking (BLF = early)
2. The phone will send the INVITE with TO header = SC + phoneNr
3. Is the same behavior as above, except that phone number = supervised line (will no prompt to user).

Call Flow:

```

Info
Request: INVITE sip:6040@206.229.26.61:5060;user=phone, with session description
Status: 401 Unauthorized
Request: ACK sip:6040@206.229.26.61:5060;user=phone

Status: 200 OK
Request: BYE sip:3778466030@62.15.232.216:5060;user=phone
Status: 200 OK
    
```

Call Forward Service

Feature Activation

A) Through the WebGui:

The activation of this feature is accessible from the WebGui in the Advanced → Call Feature section.

B) Through APS:

For this purpose, new parameters have been included in the [sip] section of the Common/MAC config files, to be able to configure the feature.

```

[sip]
CallFwdFlg=sc
CallFwdOffSC=*73
CallFwdAlwaysSC=*72
CallFwdBusySC=*90
CallFwdNoAnswerSC=*92
TransferOnRingSC=*94
    
```

C) Through Telnet:

For this purpose, new parameters have been created, described as follow:

```

sip set CallFwdFlg [local|sc]
sip set CallFwdOffSC ( Call FwdOff star code)
sip set CallFwdAlwaysSC (Call FwdAlways star code)
sip set CallFwdBusySC (Call FwdBusy star code)
sip set CallFwdNoAnswerSC (Call FwdNoAnswr star code)
sip set TransferOnRingSC (Transfer OnRing star code)
    
```

Behavior

Call Forward OFF through Keypad

1. Press Menu - Option - CallForward - Select
2. Press Change
3. Enter the CF phone number
4. Select CF type = OFF
5. Press Save
6. The phone will send the INVITE with TO header = "SC"

Call Forward Always/Busy/No Answer through Keypad

1. Press Menu - Option - CallForward - Select
 2. Press Change
 3. Enter the CF phone number
 4. Select CF type = Always/Busy/No Answer
 5. Press Save
 6. The phone will send the INVITE with TO header = "SC + phoneNr"
- **As indicated in General remarks, phone's mmi must not show any sign of this feature to be activated (icon, message on screen), to avoid synchrony issues with server**

Call Forward On ringing through Soft Key

1. Press Transfer Soft Key when the phone is ringing
 2. The phone displays "Enter a number"
 3. User enters the destination phone number to transfer to, press OK.
 4. The phone will send an INVITE with TO header = "SC + phoneNr"
- **The server is expected to cancel the initial call**

Call Flow:

Source	Destination	Protocol	Info
62.15.232.216	206.229.26.61	SIP/SDP	Request: INVITE sip:*726000@206.229.26.61;user=phone, with session description

Do Not Disturb Service

Feature Activation

A) Through the WebGui:

The activation of this feature is accessible from the WebGui in the Advanced → Call Feature section.

B) Through APS:

For this purpose, new parameters have been included in the [sip] section of the Common/MAC config files, to be able to configure the feature.

```
[sip]
DNDFlg=sc
DNDonSC=*67
DNDOffSC=*68
```

C) Through Telnet:

For this purpose, new parameters have been created, described as follow:

```
sip set DNDFlg [local|sc]
sip set DNDonSC (DND on star code)
sip set DNDOffSC (DND off star code)
```

Behavior

Do Not Disturb ON through Soft Key

1. Using the navigation keys, Press DND Soft key.
 2. Press Edit - select ON - press OK
 3. The phone will send the INVITE with TO header = SC
- **Same remark on mmi as above**

Do Not Disturb OFF through Soft Key

1. Using the navigation keys, Press DND Soft key.
 2. Press Edit - select OFF - press OK
 3. The phone will send the INVITE with TO header = SC
- **Same remark on mmi as above**

Transfer to Voicemail Service

Feature Activation

A) Through the WebGui:

The activation of this feature is accessible from the WebGui in the Setup / Basic Setup / ProfileN section.

B) Through APS:

For this purpose, new parameters have been included in the [sip] section of the Common/MAC config files, to be able to configure the feature.

```
[sip]
TrVoiceMailFlg1=local
TrVoiceMailFlg2=local
TrVoiceMailFlg3=local
TrVoiceMailFlg4=local
TrVoiceMailOnSC1=
TrVoiceMailOnSC2=
TrVoiceMailOnSC3=
TrVoiceMailOnSC4=
TrVoiceMailOffSC1=
TrVoiceMailOffSC2=
TrVoiceMailOffSC3=
TrVoiceMailOffSC4=
TrVoiceMailRingSC1=
TrVoiceMailRingSC2=
TrVoiceMailRingSC3=
TrVoiceMailRingSC4=
```

C) Through Telnet:

For this purpose, new parameters have been created, described as follow:

```
sip set TrVoiceMailFlg (profile number) (local|sc)
sip set TrVoiceMailOnSC (profile number) (star code)
sip set TrVoiceMailOffSC (profile number) (star code)
sip set TrVoiceMailRingSC (profile number) (star code)
```

Behavior

Transfer to voicemail ON

1. Using the navigation keys, press TrMail, select ON
2. The phone sends the INVITE with TO header = SC

Transfer to voicemail OFF

1. Using the navigation keys, press TrMail, select OFF
2. The phone sends the INVITE with TO header = SC

Transfer to voicemail on Ringing

1. Press TrMail when the phone is ringing
 2. The phone sends an INVITE with TO header = SC
- **The server is expected to cancel the initial call****

Call Park Service

Feature Activation

A) Through the WebGui:

The activation of this feature is accessible from the WebGui in the Advanced → Call Feature section.

B) Through APS:

For this purpose, new parameters have been included in the [sip] section of the Common/MAC config files, to be able to configure the feature.

```
[sip]
CallParkFlg=local
CallParkSC=
CallRetreiveSC=
```

C) Through Telnet:

For this purpose, new parameters have been created, described as follow:

```
sip set CallParkFlg [local|sc]
sip set CallParkSC ( Call Park star code)
sip set CallRetreiveSC (Call Retreive star code)
```

Behavior

Call Park soft key

1. During a conversation, press Call Park Soft key
2. The phone will dial the SC as DTMF.

Call Retrieve soft key

1. Press RtPark soft key
2. The phone will display "Enter a number"
3. The user will enter the orbit number
4. The phone will send the INVITE with TO header= " SC + orbit Nr"

Call Blocking Service

Feature Activation

A) Through the WebGui:

The activation of this feature is accessible from the WebGui in the Advanced → Call Blocking section.

B) Through APS:

For this purpose, new parameters have been included in the [sip] section of the Common/MAC config files, to be able to configure the feature.

```
[sip]
CallBlockFlg=local
CallBlockAllowSC=
CallBlockRejectSC=
CallBlockOFFSC=
```

C) Through Telnet:

For this purpose, new parameters have been created, described as follow:

```
sip set CallBlockFlg [local|sc]
sip set CallBlockAllowSC (Call Block Allow star code)
sip set CallBlockRejectSC (Call Block Reject star code)
sip set CallBlockOFFSC (Call Block OFF star code)
```

Behavior

Call Blocking Allowed

1. Press Menu - Option - CallBlocking - Select
2. Press Edit - Select Allowed - press Save
3. The phone will send the INVITE with TO header = SC

Call Blocking Rejected

1. Press Menu - Option - CallBlocking - Select
2. Press Edit - Select Rejected - press Save
3. The phone will send the INVITE with TO header = SC

Call Blocking OFF

1. Press Menu - Option - CallBlocking - Select
2. Press Edit - Select Disable - press Save
3. The phone will send the INVITE with TO header = SC

Privacy Call Service

Feature Activation

A) Through the WebGui:

The activation of this feature is accessible from the WebGui in the Advanced → Call Feature section.

B) Through APS:

For this purpose, new parameters have been included in the [sip] section of the Common/MAC config files, to be able to configure the feature.

```
[sip]
ClirFlg=local
ClirOnSC=
ClirOffSC=
```

C) Through Telnet:

For this purpose, new parameters have been created, described as follow:

```
sip set ClirFlg [local|sc]
sip set ClirOnSC ( Clir On star code)
sip set ClirOffSC (Clir Off star code)
```

Behavior

CLIR ON (Privacy code)

1. Press Menu - Option - NumberDisplay - Change
 2. Select ON
 3. The phone sends the INVITE with TO header= SC
- **Same remark on mmi as above**

CLIR OFF (Privacy code)

1. Press Menu - Option - NumberDisplay - Change
 2. Select OFF
 3. The phone sends the INVITE with TO header= SC
- **Same remark on mmi as above**

Call Waiting Service

Feature Activation

A) Through the WebGui:

The activation of this feature is accessible from the WebGui in the Advanced → Call Feature section.

B) Through APS:

For this purpose, new parameters have been included in the [sip] section of the Common/MAC config files, to be able to configure the feature.

```
[sip]
CallWaitingFlg=local
CallWaitingOnSC=
CallWaitingOffSC=
```

C) Through Telnet:

For this purpose, new parameters have been created, described as follow:

```
sip set CallWaitingFlg [local|sc]
sip set CallWaitingOnSC ( Call Waiting On star code)
sip set CallWaitingOffSC (Call Waiting Off star code)
```

Behavior

Call Waiting ON

1. Press Menu - Option - CallWaiting - Change
2. Select ON
3. The phone will send the INVITE with TO header= SC

Call Waiting OFF

1. Press Menu - Option - CallWaiting - Change
2. Select OFF
3. The phone will send the INVITE with TO header= SC

Special Services activation through DTMF

Notes:

- Allowed starting from multiline+1
- Add a new type "DTMF" (on top of existing Line and Supervised Line)

Feature Activation

A) Through the WebGui:

The activation of this feature is accessible from :

B) Through APS:

For this purpose, new parameters have been included in the [sys] section of the Common/MAC config files, to be able to configure the feature.

```
[sys]
Current_Max_Multiline=5
```

```
FeatureKeyExt06=L/<sip:2206>
FeatureKeyExt07=S/<sip:2207>
FeatureKeyExt08=S/<sip:2208>
FeatureKeyExt09=S/<sip:2209>
FeatureKeyExt10=D/<sip:*123456789#>
```

C) Through Telnet:

For this purpose, new parameters have been created, described as follow:

```
sys set fkuri id(1~66) uri_string
sys set fktype id(1~66) 0/1/2/3/4/5/6/7 (L/S/E/R/G/B/D/V)
```

Behavior

1. During a conversation, press the Function key
2. The phone will dial the FK number as DTMF, with configured or negotiated DTMF method.

If you press the FK in idle, there will be no action

Call Flow:

Source	Destination	Protocol	Info
10.0.0.48	10.0.0.5	SIP	Request: REGISTER sip:10.0.0.5;user=phone (remov

10.0.0.48	10.0.0.55	RTP EVENT	Payload type=RTP Event, DTMF Three 3 (end)
10.0.0.48	10.0.0.55	RTP EVENT	Payload type=RTP Event, DTMF Four 4

Other Special Services activation

Note:

- Allowed starting from multiline+1
- Add a new type in the config file syntax "V" for serVice.
- use a separator to distinguish starcode from the phone number and from starcode trailer
ie: FeatureKeyExt06=V/<sip:***8|1103|#**@domain.com>

Feature Activation

A) Through the WebGui:

The activation of this feature is accessible from:

B) Through APS:

For this purpose, new parameters have been included in the [sys] section of the Common/MAC config files, to be able to configure the feature.

```
[sys]
Current_Max_Multiline=5

FeatureKeyExt09=S/<sip:2209>
FeatureKeyExt10=V/<sip:*8|1103|#>
```

C) Through Telnet:

For this purpose, existing parameters are used, described as follows:

```
sys set fkuri id(1~66) uri_string
sys set fktype id(1~66) 0/1/2/3/4/5/6/7 (L/S/E/R/G/B/D/V)
```

Behavior

1. Press the Function key
2. The phone will display "Enter a number" displaying also the programmed number.
3. User will modify or not that number, and then press OK to dial out.
4. The phone will send an INVITE with TO header = SC + phoneNr + SC

If you press the FK during a call, it will be treated as another call (so the phone will put the current active call on hold, perform the action, and will wait for user to go back to the active call).

Ad-Hoc Conf (RFC 4579)

The TB30 is now a "conference-aware" user agent which supports SIP conferencing call control conventions defined in the RFC-4579 (Call Control - Conferencing for User Agents) as a conference participant.

TB30 as a conference-aware UA, is able to process SIP redirections such as described in Section 8.1.3.4 of RFC 3261. Can recognize the 'isfocus' feature parameter, can support REFER and SIP events. But as many of the servers which already support this feature as "focus UA" and "Conference factory" (like Netcentrex/Comverse, Broadsoft or Sylanro servers) don't support so far the subscriptions to conference package (RFC 4575 "Event Package for Conference State"), this subscribe mechanism is not implemented in the TB30.

MMI description on initiator side:

1. A and B are in a call.
2. A press "Conf" soft key (-> B is put on hold), then enters C phone's number.
3. C replies, A and C are in a 2nd call.
4. A press "Conf" again, to switch in conference mode (-> C is put on hold).
5. A creates a conference by sending an INVITE to the Conference Factory URI (as described in the section "5.4. INVITE: Creating a Conference Using Ad-Hoc SIP Methods" of the rfc-4579).

Then it will :

6. Retrieve the "conference ID" either in the 200 OK or in the 302 Moved response (in case the phone receives a 302 Moved response, it will send another INVITE to the new URI in order to really initiate the conference).
7. send REFER to B to move to conference ID (as described in section 5.6 of the rfc-4579)
8. send REFER to C to move to conference ID (as described in section 5.6 of the rfc-4579)

The expected behavior here is the Server takes care of capturing the Refers, then re-INVITE participants to the new call, and deletes old dialogs with initiator.

TB30 as Initiator is ready to receive early Byes to its Refers, with or without received Notify (200).

Here you can find an example Call-Flow of Centralized Conference:

```

Once A is in a call with the "focus UA", it could add another participant (D) in the same way:

9. A press "Conf" soft key then enters D phone's number.
10. D replies, A and D are in a 2nd call.
11. A press "Conf" again.
10. A sends REFER to D to move to conference ID (as described in section 5.6 of the rfc-4579).

Another variant:

1. A and B are in a call.
2. C calls A
3. A replies, A and C are in a 2nd call, B is on hold.
4. A press "Join" to switch in conference mode.
5. Phone A shall send an INVITE to the Conference Factory URI.
6. It will retrieve the "conference ID" either in the 200 OK or the 302 Moved response.
7. send REFER to B to move to conference ID (as described in section 5.6 of the rfc-4579)

8. send REFER to C to move to conference ID (as described in section 5.6 of the rfc-4579)

Feature Activation

A) Through the WebGui:

The activation of this feature is accessible from the WebGui in the Advanced → Call Feature section.

B) Through Telnet:

For this purpose, two new parameters have been created, described as follow:

```

sip set conference_mode [ 0 (Local Conference)/
                          1 (Network Conference)/
                          2 (Centralized Conference (RFC4579))]

sip set conf_uri (Max 191 chars)
    
```

To configure, open a command line console, and telnet the phone:

C) Through APS:

For this purpose, two new parameters have been included in the [sip] section of the Common/MAC config files, to be able to configure the conference mode and the conference factory URI.

```

[sip]
...
ConferenceMode=2
ConferenceFactoryURI=conf
...
    
```

The parameter "ConferenceFactoryURI" could be either a SIP URI or a phone number. The default value is "conf".

Examples:

```

ConferenceFactoryURI=5000
ConferenceFactoryURI=conference@10.0.0.1
ConferenceFactoryURI=conf
    
```

Sylantro SIP-B

Correction of the known limitations and bug fixing of the Sylantro SIP-B provided in the release SG1.58.

Please refer to the document "TB30 SIP Sylantro SIP-B features.pdf" for more Info.

Identity Header Precedence

This new feature specifies how the “source” for the caller/called party identity display, will be determined.

There are a number of SIP headers that can include calling (INVITE) or called (in 200 OK) party information.

A little history from “**draft-ietf-sip-privacy-xx**” to “**RFC3325**”:

1. The calling party number was stored in the SIP **From header** in the initial SIP RFC 2543.
2. Later, **Remote-Party-ID** header was added in “draft-ietf-sip-privacy-xx” file,
3. Then Remote-Party-ID was not standard anymore and has been replaced with **P-Asserted-Identity** header (PAI) in RFC3325.
4. Finally, as User Agent can have multiple Identities, **P-Preferred-Identity** header was added to carry the identity the user wishes to be used.

This feature allows use of any of the possible headers where the calling number can be stored.

Some examples:

```
P-Asserted-Identity: "Daniel Ananikian"<sip:35780207@10.0.0.5>
P-Asserted-Identity: "Daniel Ananikian"<tel:+3545780207>
Privacy: none
P-Charging-Vector: icid-value=69baafa30ecef0838epakfjhhk99968cf2da
P-Called-Party-ID: <sip:5780209@10.0.0.5>
-----
P-Charging-Vector: icid-value="jap07g86pl80js87jhdK3q066bmhhehlc061ld2jso";icid-generated-at=10.210.10.100
P-Asserted-Identity: sip:marta.diaz@fly.com
P-Called-Party-ID: <sip:+3232407037@fly.com>
-----
P-Asserted-Identity: <sip:+3546699711@tes.ims.c.is>
Privacy: none
P-Charging-Vector: icid-value=c21770c404f7010854cceaaf88a0c7
P-Called-Party-ID: <tel:+3545948801>
-----
P-Asserted-Identity: "Teresa Arredondo" <sip:+420277000331@vodafone.cz>
P-Charging-Vector: icid-value=b7ccf8be04fbc30848aa9a0aed19a
P-Called-Party-ID: <sip:+420244026445@vodafone.cz>
Remote-Party-ID: "Teresa Arredondo" <sip:+420277000331@vodafone.cz>;party=calling;privacy=off;screen=yes;screen-ind=1;npi=1;ton=2
Remote-Party-ID: <sip:244026445@vodafone.cz>;party=called;npi=1;ton=2
```

Different softswitch vendors use one or more of the different headers to provide information, and there is not a clear common criterion to all of them on the priority to be applied.

Moreover, TB30 phones have a local phonebook.

Phonebook shall be always the 1st priority, but the header to look for in the phonebook will depend on the priority of the headers.

So two new variables are defined for “header priority”, default value being as follows:

```
CLIPDisplayPrior=pprefered(1)passerted(2)remoteparty(3)from(4)
CalledDisplayPior=dialed(1)passerted(2)remoteparty(3)
```

Precedence mechanism to be applied is:

When a call is received, phone will check which is the header with the highest priority present in the INVITE ("presentation candidate") comparing with `CLIPDisplayPrior`. Once found, will check whether this address exists in the local phonebook or not. If it does, it will present phonebook info, otherwise, it will present the "candidate".

For outgoing calls, it is the same: check highest priority (dialed digits or header in 200 OK), to determine "presentation candidate" comparing with `CalledDisplayPrior`. Will use that to check the local phonebook. If existing in the phonebook, it will present phonebook info. Otherwise, it will present the "candidate".

Feature Activation

A) Through the WebGui:

This feature can not be configured through the Web.

B) Through Telnet:

For this purpose, two new parameters have been created, described as follow:

```
sip set clip_display_pri <pprefered> <passerted> <remoteparty> <from>
(Priority: 1~4, 1:Highest, 4:Lowest)

sip set called_display_pri <dialed> <passerted> <remoteparty> (Priority:
1~3, 1:Highest, 3:Lowest)
```

To configure, open a command line console, and telnet the phone:

C) Through APS:

For this purpose, two new parameters have been included in the [sip] section of the Common/MAC config files, to be able to configure the priority.

```
[sip]
...
CLIPDisplayPrior=pprefered(1)passerted(2)remoteparty(3)from(4)
CalledDisplayPrior=dialed(1)passerted(2)remoteparty(3)
...
```

The number in parenthesis means priority, where 1 means the highest one.

NAT Keep Alive

When the phone is installed behind a gateway or in another LAN than the Proxy, it is likely that we will face NAT traversal problems.

One solution is the automatic allocation of ports by the border router or gateway. But this allocation is not maintained forever.

So once registered with the SIP Registrar, the phone must maintain the channel open by sending keep-alive packets to the SIP server before the binding expires in the NAT device.

SIP OPTIONS message (cf. RFC3261 page 67) will be used to keep the NAT open. An example of the Option packet is as follow:

```
OPTIONS sip:10.0.0.5;user=phone SIP/2.0
Via: SIP/2.0/UDP 10.0.0.48:5060;branch=z9hG4bK5708696430465310310-6772
From: <sip:2207@10.0.0.5:5060>;tag=c0a80101-1a74
To: <sip:10.0.0.5>
Call-ID: 34ac-c0a80101-2-2@10.0.0.48
CSeq: 1 OPTIONS
Max-Forwards: 70
Contact: <sip:2207@10.0.0.48:5060;user=phone>
Accept: application/sdp
User-Agent: THOMSON TB30 hw5 fw1.61 00-14-7F-E1-81-F9
Content-Length: 0
```

Call flow example:

No.	Time	Source	Destination	Protocol	Info
63	29.095990	10.0.0.48	10.0.0.5	SIP	Request: REGISTER sip:10.0.0.5;user=phone
64	0.000760	10.0.0.5	10.0.0.48	SIP	Status: 401 Unauthorized (0 bindings)
65	0.007159	10.0.0.48	10.0.0.5	SIP	Request: REGISTER sip:10.0.0.5;user=phone
66	0.000737	10.0.0.5	10.0.0.48	SIP	Status: 200 OK (0 bindings)
67	0.009248	10.0.0.48	10.0.0.5	SIP	Request: REGISTER sip:10.0.0.5;user=phone
68	0.000457	10.0.0.5	10.0.0.48	SIP	Status: 401 Unauthorized (0 bindings)
69	0.009533	10.0.0.48	10.0.0.5	SIP	Request: REGISTER sip:10.0.0.5;user=phone
71	0.082599	10.0.0.5	10.0.0.48	SIP	Status: 200 OK (1 bindings)
72	0.007478	10.0.0.48	10.0.0.5	SIP	Request: OPTIONS sip:10.0.0.5;user=phone
73	0.000780	10.0.0.5	10.0.0.48	SIP	Status: 200 OK
183	60.011652	10.0.0.48	10.0.0.5	SIP	Request: OPTIONS sip:10.0.0.5;user=phone
184	0.000785	10.0.0.5	10.0.0.48	SIP	Status: 200 OK
297	60.011878	10.0.0.48	10.0.0.5	SIP	Request: OPTIONS sip:10.0.0.5;user=phone
298	0.000780	10.0.0.5	10.0.0.48	SIP	Status: 200 OK
387	60.011713	10.0.0.48	10.0.0.5	SIP	Request: OPTIONS sip:10.0.0.5;user=phone
388	0.000786	10.0.0.5	10.0.0.48	SIP	Status: 200 OK
489	60.011935	10.0.0.48	10.0.0.5	SIP	Request: OPTIONS sip:10.0.0.5;user=phone
490	0.000774	10.0.0.5	10.0.0.48	SIP	Status: 200 OK

Two parameters have been created:

1. The destination address for the SIP OPTIONS request. It could be either an SIP URI (or only the host part), an ip address or a domain name.

Examples:

```
KeppAliveDest=server@domain.com
KeppAliveDest=122.22.22.22
KeppAliveDest=domain.com
```

2. The time interval between 2 SIP OPTIONS requests.
 The value is in seconds and between 0 and 600.
 With 0 meaning disable sending Keep-Alive packets (default value).

Examples:

```
KeepAliveTimer=0
KeepAliveTimer=120
```

Feature Activation

A) Through the WebGui:

This feature can not be configured through the Web.

B) Through APS:

For this purpose, two new parameters have been included in the [sip] section of the Common/MAC config files, to be able to configure the nat.

```
[sip]
...
KeppAliveDest=0.0.0.0
KeepAliveTimer=0
...
```

C) Through Telnet:

For this purpose, two new parameters have been created, described as follow:

```
sip set NatkeepaliveDest (Max 127 chars)
sip set NatkeppaliveTimer (range 0 - 600)
```

To configure, open a command line console, and telnet the phone:

Trusted IP for Notify "check-sync"

Up to now it was possible to send a SIP NOTIFY message to the phone, to launch remotely the automatic provisioning.

3.4 SIP NOTIFY (SIP only)

The phone launches provisioning upon reception of a SIP NOTIFY :

```
NOTIFY sip: CLI@IP_ADDRESS_SIP_SERVER:5060;transport=UDP SIP/2.0
Call-ID: 03945c5ecd70248d6e76b8f0e6c64a13@10.107.111.189
CSeq: 460015 NOTIFY
From: <sip:webadmin@operator.com>;tag=8542
To: <sip: CLI@operator.com:5060>
Via: SIP/2.0/UDP
82.91.55.123:5061;branch=z9hg4bk917de6b406ebc8d056971e03991fdde6
Max-Forwards: 70
Contact: <sip:82.91.55.123:5061;transport=UDP>
Event: check-sync
Content-Length: 0
```

The phone may reboot or not, whether an upgrade is actually performed or not (i.e. a new FW or configuration is available).

There is a security issue: a cracker may broadcast such packets to the network frequently and cause the phones to reboot constantly. Therefore the usage of this feature is configurable via a "Use SIP NOTIFY to launch provisioning" parameter. Default value is 'No'.

To avoid attacks once the feature is enabled (as mentioned above), an additional parameter has been created to contain the authorized server from which the Notify is going to be allowed.

NOTIFY messages with event=check-sync, coming from other servers are ignored.

To minimize the impact of such attacks, the phone will not send any response.

The default value will be 0.0.0.0, which means the phone will accept all NOTIFY (check-sync) messages coming from everywhere.

This parameter shall be either an IP address or a domain name.

Remember that the proper APS pre-configuration should be:

```
[sip]
sw_notify_autoprovision=1
AuthNotifyCheckSync=10.0.0.1

[autoprovision]
AutoprovisionFlag=1
AutoprovisionTFTPServer=10.0.0.1
AutoprovisionConfigname=TB30S.inf
```

An example Call Flow:

```

4.936427 10.0.0.55 10.0.0.5 SIP Request: REGISTER sip:10.0.0.5;user=phone (remove all bindings)
0.000817 10.0.0.5 10.0.0.55 SIP Status: 401 Unauthorized (0 bindings)

0.005699 10.0.0.55 10.0.0.5 SIP Request: REGISTER sip:10.0.0.5;user=phone
0.003553 10.0.0.5 10.0.0.55 SIP Status: 200 OK (1 bindings)

```

Feature Activation

A) Through the WebGui:

This feature can not be configured through the Web.

B) Through Telnet:

For this purpose, a new parameter has been created, described as follow:

```

sip set auth_notify_sync_srv (Max 127 chars)

```

To configure, open a command line console, and telnet the phone:

C) Through APS:

For this purpose, a new parameter has been included in the [sip] section of the Common/MAC config files, to be able to configure the server.

```

[sip]
...
AuthNotifyCheckSync=10.0.0.1
...

```

Reboot on Notify "check-sync; reboot=true"

In the implementation existing prior to this new version, when the phone received NTFY check-sync, it did not force reboot, but start APS procedure. Therefore, it was necessary to have TFTP/HTTP server and ".inf" filename pre-configured. Otherwise, APS could not start.

But in scenarios where the APS must be done by DHCP, NTFY check-sync is not enough, because pre-configuration has a higher priority than the options obtained by DHCP.

So a new parameter will now be used to recognize when a NTFY check-sync needs to force the reboot of the phone.

This parameter will be located in the Event header of the NOTIFY like:

```
Event: check-sync --> default, no reboot, only APS, preconfig needed
Event: check-sync;reboot=false --> default, no reboot, only APS, preconfig needed

Event: check-sync;reboot=true --> force reboot, no need for preconfig (can still be used)
```

This parameter is optional.

Remember now, that the proper minimum configuration would be:

```
[sip]
sw_notify_autoprovision=1
AuthNotifyCheckSync=10.0.0.1

[autoprovision]
AutoprovisionFlag=1
```

An example Call Flow where the phone takes the APS configuration from the DHCP options would be:

4.954874	10.0.0.55	10.0.0.5	SIP	Request: REGISTER sip:10.0.0.5;user=phone	(remove all bindings)

Downloadable/Uploadable Local Phonebook

As requested by many customers, we have included the possibility to save, edit and load the local phonebook of the IP phone.

This feature allows you (the user) to copy the local Phonebook directory from your TB30 phone to your PC. So for example, when a phone is out of order or must be replaced or be reset to default, the user can now make a backup and then recover all the entries stored in its phonebook.

A directory entry will have:

- Name
- Phone number

The personal phonebook will use the following XML format:

```
<ThomsonPhoneBook>
  <DirectoryEntry>
    <Name>Alice Abbot</Name>
    <Telephone>2200</Telephone>
  </DirectoryEntry>
  <DirectoryEntry>
    <Name>Bernard Bishop</Name>
    <Telephone>2201</Telephone>
  </DirectoryEntry>
  <DirectoryEntry>
    <Name>Carol Camps</Name>
    <Telephone>2202</Telephone>
  </DirectoryEntry>
</ThomsonPhoneBook>
```

Up to 100 entries can be stored in the TB30 phones.

Note that if you are going to upload a file through the WebGui, all current entries will be deleted, and all the entries which are in the file will be added.

Feature Activation

A) Through the WebGui:

You can load/download through the "Advanced → Phone Book" Web page:

B) Through Telnet:

To configure, open a command line console, and telnet the phone:

```

*****
** IP Phone firmware                               U3.61          **

```

Mixed paging Remote Phonebook

In the implementation prior to this sw version, TB30 could accept 2 kinds of syntax in the XML reply from the server:

1- Less than 32 results to the query with directory entries:

```
<ThomsonPhoneBook>
<DirectoryEntry>
  <Name>Dupad André</Name>
  <Telephone>0175008348</Telephone>
</DirectoryEntry>
...
<DirectoryEntry>
  <Name>Dupont Antoine</Name>
  <Telephone>0175008338</Telephone>
</DirectoryEntry>
</ThomsonPhoneBook>
```

2- Or more than 32 results to the query with menu items:

```
<ThomsonPhoneMenu>
<MenuItem>
  <Name>Arrh to Foulard</Name>
  <URL>http://www.server.com/get32results_1.php</URL>
</MenuItem>
...
<MenuItem>
  <Name>Roger to Ziad </Name>
  <URL>http://www.server.com/get32results_7.php</URL>
</MenuItem>
</ThomsonPhoneMenu>
```

If the phone could support a mix of these 2 syntaxes, the server could send a list of phone numbers followed by a link to the next part of the reply. This could make the research more intuitive for the user.

So we have included the following feature: The phone can support a mixed syntax in the XML reply like:

```
<PhoneBook>
<MenuItem>
  <Name>Previous-Page...</Name>
  <URL>http://www.server.com/Paging.php?NAME=M&PAGE=0</URL>
</MenuItem>
<DirectoryEntry>
  <Name>Maldonado, Juan</Name>
  <Telephone>10022382</Telephone>
</DirectoryEntry>
<DirectoryEntry>
  <Name>Manilla, Antonio</Name>
  <Telephone>10022383</Telephone>
</DirectoryEntry>
<DirectoryEntry>
  <Name>Marco, Tomás</Name>
  <Telephone>10022384</Telephone>
</DirectoryEntry>
<MenuItem>
  <Name>Next-Page...</Name>
  <URL>http://www.server.com/Paging.php?NAME=M&PAGE=2</URL>
</MenuItem>
</PhoneBook>
```

In previous example, for “MenuItem” elements, the content of the tag “Name” would be literally shown on the screen, and when selected would launch the url contained in “URL” tag.

As an alternative, an additional tag has been defined within “MenuItem”, in order to support keywords. The new tag is “Item”, and this would be a usage example:

```
<PhoneBook>
<MenuItem>
  <Item>previous-page</Item>
  <URL>http://www.server.com/Paging.php?NAME=M&PAGE=0</URL>
</MenuItem>
<DirectoryEntry>
  <Name>Maldonado, Juan</Name>
  <Telephone>10022382</Telephone>
</DirectoryEntry>
<DirectoryEntry>
  <Name>Manilla, Antonio</Name>
  <Telephone>10022383</Telephone>
</DirectoryEntry>
<DirectoryEntry>
  <Name>Marco, Tomás</Name>
  <Telephone>10022384</Telephone>
</DirectoryEntry>
<MenuItem>
  <Item>next-page</Item>
  <URL>http://www.server.com/Paging.php?NAME=M&PAGE=2</URL>
</MenuItem>
</PhoneBook>
```

In that case, the text between <Item> start-tag and end-tag will not be displayed as it is. Rather the phone will display an associated string in the language table and thus linked to the selected language on the phone. 2 keywords are supported: “next-page” and “previous-page”.

Additional strings generated for the language table:

Keywords	English	French	Spanish	German	Italian
next-page	Next	Suivant	Siguiente	Nächste	Seguente
previous-page	Previous	Précédent	Anterior	Vorig	Precedente

Keywords	Norway	Russian	Portuguese	Netherlands
next-page	Neste	Следующий	Seguinte	Volgende
previous-page	Tidligere	Предыдущий	Precedente	Vorig

Feature Activation

Feature is activated by default, all you need is a remote phonebook using this structure.

You can check this new feature by configuring the remote phonebook like this, and uploading to your http server the example provided with this release:

An example of a normal Call Flow:

```
2.908082 10.0.0.48 10.0.0.5 SIP/SDP Request: INVITE sip:2205@10.0.0.5:5060;user=phone, with session description
0.001384 10.0.0.5 10.0.0.48 SIP Status: 401 Unauthorized
0.007985 10.0.0.48 10.0.0.5 SIP Request: ACK sip:2205@10.0.0.5:5060;user=phone
0.001255 10.0.0.48 10.0.0.5 SIP/SDP Request: INVITE sip:2205@10.0.0.5:5060;user=phone, with session description
0.001705 10.0.0.5 10.0.0.48 SIP Status: 100 Trying
0.001810 10.0.0.5 10.0.0.48 SIP Status: 603 Declined
0.011068 10.0.0.48 10.0.0.5 SIP Request: ACK sip:2205@10.0.0.5:5060;user=phone
16.381904 10.0.0.48 10.0.0.1 HTTP GET http://10.0.0.1/Paging.php?NAME=M HTTP/1.1
0.007350 10.0.0.1 10.0.0.48 HTTP HTTP/1.1 200 OK (text/html)
5.624714 10.0.0.48 10.0.0.1 HTTP GET http://10.0.0.1/Paging.php?NAME=M&PAGE=1 HTTP/1.1
0.009871 10.0.0.1 10.0.0.48 HTTP HTTP/1.1 200 OK (text/html)
```

Login/logout – disable Subscribe to dialog

In the context of the Login/Logout feature, the phone subscribes to the **Dialog Event** before trying to register with a dynamic personal profile or static personal profile, to ensure any phone potentially registered with this profile is not in conversation or ringing).

Some servers don't allow such subscriptions, or the real phone number is different from the Authentication ID (login parameter).

So the Login procedure is aborted due to non response from server side, or to an error message other than expected 404 Not Found.

To be able to set up a simple Login/Logout procedure without sending such Subscribe to Dialog event, a new parameter will be created:

1. If value=0 => the phone will skip the Subscription to the dialog event and directly Register with the personal dynamic profile.
2. If value=1 => Enable Subscribe to Dialog event before Register. If the SUBSCRIBE gets a 404 Not Found response, then PhoneA will consider the account is not in use and will proceed with the login process. If receives a Notify with the status as "terminated" then the login can go on. If it's not the case, the phone must abort the login procedure.

Default value will be 1 which means the phone will Subscribe to dialog event before registering (behavior prior to this new sw release).

Feature Activation

A) Through the WebGui:

This feature can not be configured through the Web.

B) Through Telnet:

For this purpose, a new parameter has been created, described as follow:

```

sip set subdlgbflogin_flag [0(Disable)/ 1(Enable)]
    
```

To configure, open a command line console, and telnet the phone:

C) Through APS:

For this purpose, a new parameter has been included in the [sip] section of the Common/MAC config files, to be able to configure the feature. Remember the proper APS configuration to activate the Login/Logout feature at the highest feature level:

```

[ipp]
ManualLog=1
    
```

```
[sip]
SubscribeDilaogBeforeLogin=0
RegEventServer=RegEvent
```

```
[sys]
PSettingURLul=http://www.server.com/upload.php?Login_ID=#LOGIN;Passwr=#PASSWORD
PSettingURLdl=http://www.server.com/download.php?Login_ID=#LOGIN;Passwr=#PASSWORD
PCallLogURL=http://www.server.com/call-log.php?Login_ID=#LOGIN;Passwr=#PASSWORD
```

And the minimum configuration for a basic Login/logout without Subscribe to dialog would be:

```
[ipp]
ManualLog=1
```

```
[sip]
SubscribeDilaogBeforeLogin=0
```

A call flow for reference :

Tracing tool

Tracing tool is a new feature that allows administrators to get SIP level traces remotely. Through telnet phone interface, sent and received SIP messages flow can be obtained. SIP data provided by this tool is shown split in headers and packet body as follows:

```

Recv from udp: 10.0.0.5:5060 00:00:00:01:066 (937 bytes)

INVITE sip:2205@10.0.0.55:5060 SIP/2.0
Via: SIP/2.0/UDP 10.0.0.5:5060;branch=z9hG4bK2b55f27f;rport
From: "Thomson-2204" <sip:2204@10.0.0.5>;tag=as1b93c676
To: <sip:2205@10.0.0.55:5060>
Contact: <sip:2204@10.0.0.5>
Call-ID: 7b068be424cee3565279b5cb075e248b@10.0.0.5
CSeq: 102 INVITE
User-Agent: Asterisk 1.4.11
Max-Forwards: 70
Remote-Party-ID: "Thomson-2204" <sip:2204@10.0.0.5>;privacy=off;screen=no
Date: Mon, 14 Jan 2008 14:17:14 GMT
Allow: INVITE, ACK, CANCEL, OPTIONS, BYE, REFER, SUBSCRIBE, NOTIFY
Supported: replaces
Alert-Info: <http://notused.com>;info=Clocks
P-Asserted-Identity: <sip:Asterisk@10.0.0.5>
Content-Type: application/sdp
Content-Length: 254

v=0
o=root 2036 2036 IN IP4 10.0.0.5
s=session
c=IN IP4 10.0.0.5
t=0 0
m=audio 17836 RTP/AVP 0 8 101
a=rtpmap:0 PCMU/8000
a=rtpmap:8 PCMA/8000
a=rtpmap:101 telephone-event/8000
a=fmtp:101 0-16
a=silenceSupp:off - - - -
a=ptime:20
a=sendrecv
    
```

At first glance it can be noted there are two parts in the information for each packet.

The first one includes:

- packet sent or received
- destination address and port (for a sent packet) or source (for received packet).
- a time stamp, to locate the packets in the real time
- packet size

Second part is packet content itself.

Feature Activation

To use Tracing tool, a telnet connection has to be open. Then, feature will be enabled or disabled through a command: `sip tracer on / sip tracer off`.

Usual steps and output example:

```
telnet <ip>
Login: administrator
Password: 789234

[administrator]# sip tracer on

[administrator]#

[administrator]# Recv from udp: 10.0.0.5:5060 00:00:00:01:066 (937 bytes)

INVITE sip:2205@10.0.0.55:5060 SIP/2.0
Via: SIP/2.0/UDP 10.0.0.5:5060;branch=z9hG4bK2b55f27f;rport
From: "Thomson-2204" <sip:2204@10.0.0.5>;tag=as1b93c676

Download and update tone and language tables

Downloading and updating Tone table or Language table capability has been added to improve and enhance admin possibilities in terms of managing languages and tones of his/her phone/s.

Phone provides 9 language tables (English, French, Spanish, German, Italian, Norway, Russian, Portuguese, Deutsch), and now, 1 more extra language that can be uploaded by the admin.

Likewise, phone provides 11 tone tables (United States, France, Germany, Italy, Netherlands, Portugal, Spain, United Kingdom, Czech Rep, Slovenia, Austrian), and now, 1 more extra tone table that can be uploaded by admin.

Currently, TB30 only support one additional table for Language and Tone, and user **can not** modify the original Tone or Language tables.

How to get the Templates:

To create the new extra Tone or Language table, first you must dump one file via Web GUI or Telnet, then modify and upload it, based on the dumped file.

A) Through Telnet

```
[administrator]# tftp2
tftp2 telcfg X.X.X.X filename [f/F]
tftp2 all X.X.X.X filename [f/F]
tftp2 melody X.X.X.X filename
tftp2 sys_melody X.X.X.X filename
tftp2 cwt_melody X.X.X.X filename
tftp2 listparms X.X.X.X filename
tftp2 listlangtable X.X.X.X filename Language-index
tftp2 langtable X.X.X.X filename
tftp2 listtonetable X.X.X.X filename Country-index
      US<0> - UNITED STATES
      FR<1> - France
      DE<2> - Germany
      IT<3> - Italy
      NL<4> - Netherlands
      PT<5> - Portugal
      ES<6> - Spain
      GB<7> - UNITED KINGDOM
      CZ<8> - CZECH Rep.
      SI<9> - Slovenia
      AT<10> - Austrian
      XX<11> - Extra<Downloadable> Country tone
tftp2 tonetable X.X.X.X filename
tftp2 putimage X.X.X.X filename [f/F]
tftp2 putfile X.X.X.X filename [f/F]
```

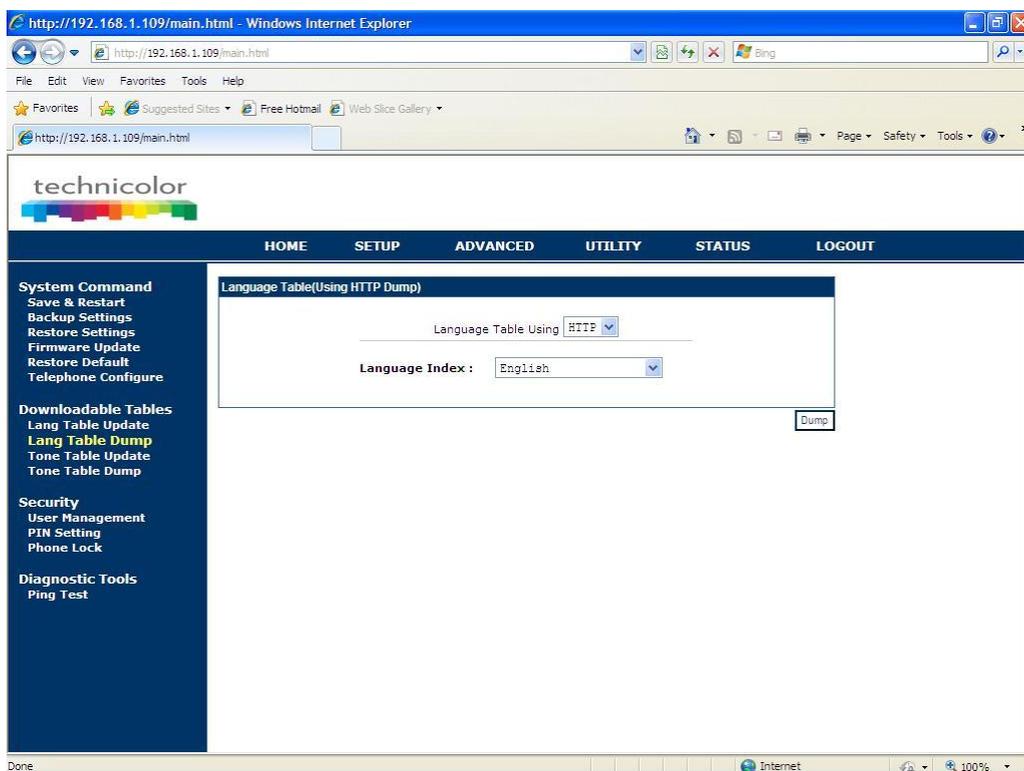

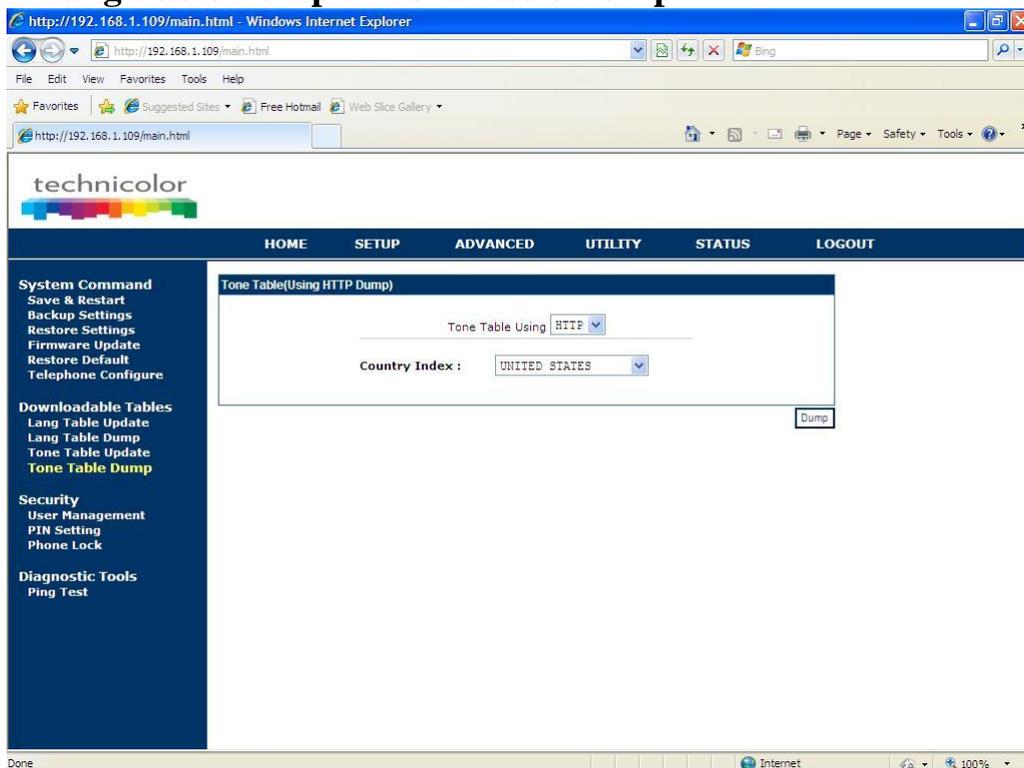

For example, to get US Tone Table:

```
[administrator]# tftp2 listtonetable 10.0.0.1 ToneTbl.zz 0
```

or, to get English language Table:

```
[administrator]# tftp2 listlangtable 10.0.0.1 LangTable.zz 0
```

B) Through the Web Gui: Utility ->Lang Table Dump or Tone Table Dump

Finally we will have the Templates to create the new tables:

Nombre	Tamaño	Tipo	Fecha de modificación
LangTbl.zz	28 KB	Archivo ZZ	07/02/2008 13:39
ToneTbl.zz	9 KB	Archivo ZZ	07/02/2008 14:13

How to modify the Templates:

Tone/Language template files are "txt" files and follow XML format:

```
<ThomsonLanguageTable>
  <ProductName>ST2030(S)</ProductName>
  <Country>NewOne</Country>
  <Charset>Latin-1</Charset>
  <ThomsonDisplayString>
    <Switch>
      <SwitchOFF>OFF</SwitchOFF>
      <SwitchON>ON</SwitchON>
    </Switch>

    <Block>
      <BlockOFF>Unblock</BlockOFF>
      <BlockON>Block</BlockON>
    </Block>

    <LineStatus>
      <LS-Idle>Idle</LS-Idle>
      <LS-Ring>Ring</LS-Ring>
      <LS-Talking>Talking</LS-Talking>
  </ThomsonDisplayString>
</ThomsonLanguageTable>
```

```
<ThomsonToneTable>
  <Country-TableName>NewOne</Country-TableName>
  <Busy>
    <Num-of-Element>2</Num-of-Element>
    <Tone-Element-1>
      <Num-of-Tones>2</Num-of-Tones>
      <Freq-1>480</Freq-1>
      <Amp-1>-240</Amp-1>
      <Freq-2>620</Freq-2>
      <Amp-2>-240</Amp-2>
      <Duration>500</Duration>
    </Tone-Element-1>

    <Tone-Element-2>
      <Num-of-Tones>0</Num-of-Tones>
      <Duration>500</Duration>
    </Tone-Element-2>
  </Busy>

  <Ring-Back>
    <Num-of-Element>2</Num-of-Element>
```

If you modify:

```
<ThomsonToneTable>
  <Country-TableName>Spain 2</Country-TableName>
  <Busy>
    <Num-of-Element>2</Num-of-Element>
    ...
  </Busy>
  ...
</ThomsonToneTable>
```

This means the name of the extra tone table will be "Spain 2".

And:

```
<ThomsonLanguageTable>
  <ProductName>TB30(S)</ProductName>
  <Country>Czech</Country>
  <Charset>Latin-2</Charset>
  <ThomsonDisplayString>
    ...
  ...
</ThomsonLanguageTable>
```

This means the name of the extra language table will be "Czech".

The new language table should be based on Latin-1, Latin-2, Cyrillic and Hebrew character set. The character table name must be indicated in the language file in the tag:

```
<ThomsonLanguageTable>
  <ProductName>TB30(S)</ProductName>
  <Country>Czech</Country>
  <Charset>Latin-2</Charset>
  <ThomsonDisplayString>
    <Switch>
      <SwitchOFF>OFF</SwitchOFF>
      <SwitchON>ON</SwitchON>
    </Switch>

    <Block>
      <BlockOFF>Odblokovat</BlockOFF>
      <BlockON>Blokovat</BlockON>
    </Block>

    <LineStatus>
      <LS-Idle>Neèinný</LS-Idle>
      ...
  ...
</ThomsonLanguageTable>
```

Words the admin can modify are the ones between xml tags.

Limitations:

1. Tone table limits - >
 - Country-TableName is up to 64 characters,
 - Num-of-Element is up to 6,
 - Num-of-Tones is up to 4,
 - Freq (frequency) is up to 3000Hz,
 - Amp is between -800 ~ +30 (*0.1 db),
 - Duration is up to 60000 seconds.

2. Language table limits - >

Length limit - > refer to the limit of MMI display

 - LCD Central Line – 20 characters (TB30),
 - right upper corner of LCD – 6 characters;
 - soft keys – 6 characters (TB30),

Reserved characters should be used as follows within Language and Tone tables:

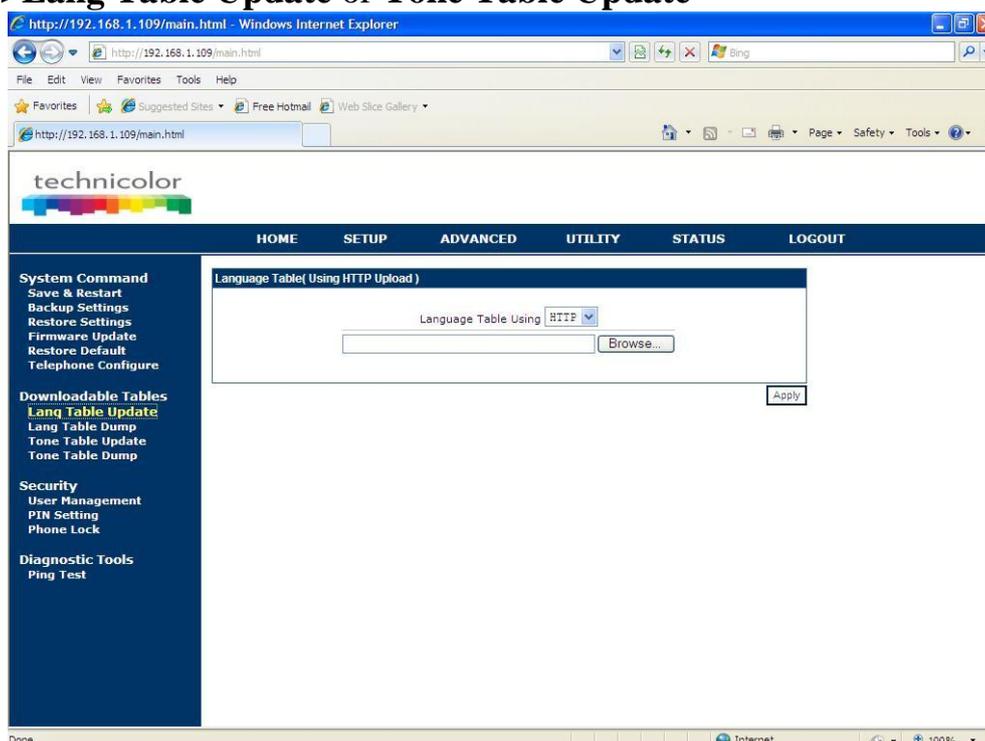

- & → &
- < → <
- > → >
- ' → '
- " → "

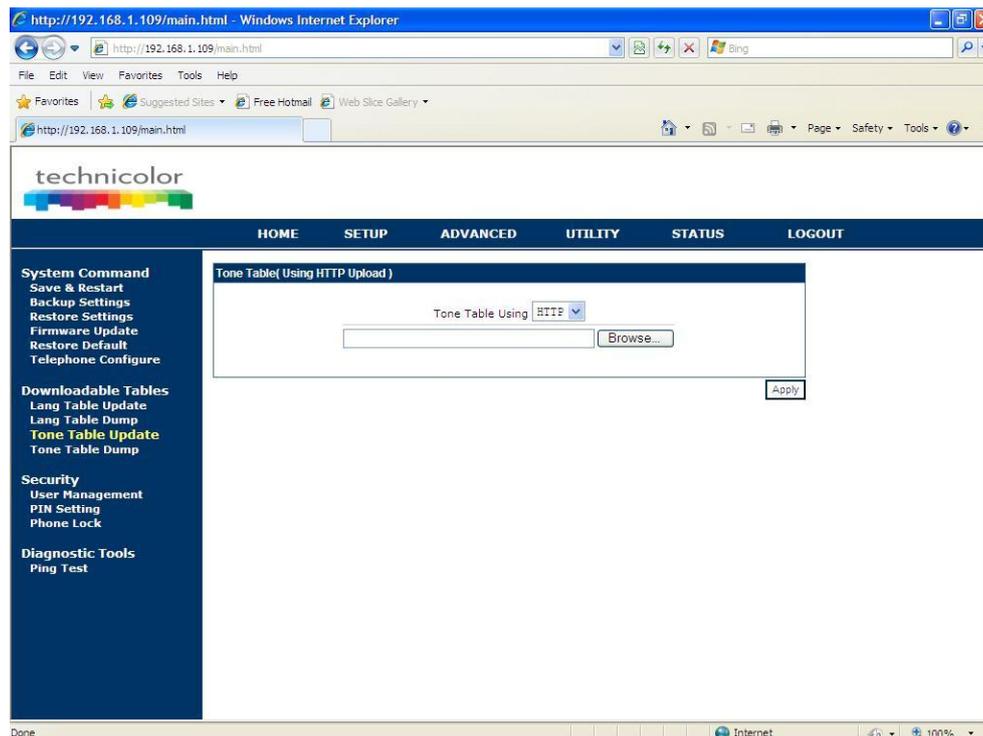

How to upload the Templates:

Language and tone tables can be uploaded using APS, through telnet application or via Web GUI.

A) Through the Web Gui:

Utility ->Lang Table Update or Tone Table Update

B) Through Telnet

```
[administrator]# tftp2 langtable 10.0.0.1 LangTable.zz
```

```
[administrator]# tftp2 tonetable 10.0.0.1 ToneTbl.zz
```

C) Through APS:

- File Syntax for TFTP APS:

```
[application]
fw_filename=v2030SG.080227.1.59.3.zz

[config]
telcfg=TelConf2030SG_v1.59.3.txt
common_config=ComConf2030SG_v1.59.3.txt
melodies=Melodies.txt
system_melodies=Sys_Ringtones.txt
call_waiting_tone=Bellcore_CW.txt
tone_table=ToneTable.txt
language_table=LangTable.txt
```

- File Syntax for HTTP APS:

```
[application]
fw_url=http://10.8.1.217/v2030SG.080227.1.59.3.zz

[config]
common_config=http://10.8.1.217/ComConf2030SG_v1.59.3.txt
telcfg=http://10.8.1.217/TelConf2030SG_v1.59.3.txt
melodies=http://10.8.1.217/Melodies.txt
```

```
system_melodies=http://10.8.1.217/Sys_Ringtones.txt
call_waiting_tone=http://10.8.1.217/ Bellcore_CW.txt
tone_table=http://10.8.1.217/tonetable.txt
language_table=http://10.8.1.217/langtable.txt
config=http://10.8.1.217/
```

The files are temporarily uploaded, so they will be deleted after reset to default.

Feature Activation

Once the files have been uploaded, user can activate them by the following means:

A) Through Keypad : Only Language table can be changed. Menu → Config → Personalize → Lang option → Edit → choose your own table and save.

B) Through Telnet : Only Tone table can be changed:

```
[administrator]# sys set country
      US - UNITED STATES
      FR - France
      DE - Germany
      IT - Italy
      NL - Netherlands
      PT - Portugal
      ES - Spain
      GB - UNITED KINGDOM
      CZ - CZECH Rep.
      SI - Slovenia
      AT - Austrian
      XX - Spain 2
[Error] Syntax error
[administrator]# sys set country XX
[OK] Set OK
```

C) Through APS :

```
[ipp]
LanguageType=9 (from 0-English to 9-extra lang)
...
[sys]
CountryCode=XX (XX to choose extra tone table)
```

SIP MESSAGE support (rfc 3428) for Status display applications

More and more, services supported locally by the phone are also supported centrally by the IP PBX or softswitch (call forwarding, call rejection, call block ...).

Unlike the local services, there is no indication on the screen when the user activates these services on the server.

With the SIP MESSAGE method, the server could push short messages to the phone indicating its current status. These messages will be displayed on the phone's screen.

A parameter has been created with purpose to avoid attacks. Messages coming from other servers which were not the configured one on parameter will be rejected.

The text contained in the SIP MESSAGE body is displayed on the 4th line of the LCD for TB30.

SIP MESSAGE text location on TB30:

Date	Hour	Icons
Phone Name		
Phone Number		
SIP MESSAGE text location		
Softkey1	Softkey2	Softkey3

Feature Activation

This feature does not need specific activation to be supported. But a parameter has been created to avoid messages attacks from non desired sources. Parameter is AuthMessageServer. Default value is 0.0.0.0, which means phone accepts all messages received from everywhere. Otherwise, to limit from which server messages can be accepted, this parameter should contain either SIP messages server IP address or domain name.

This parameter only can be configured in section [sip] of common or MAC config files.

For example:

[sip]

...

AuthMessageServer=192.168.1.1 (or AuthMessageServer=domain.com)

...

Disable Call Waiting Tone

This new feature, we add the possibility to enable or disable the call waiting tone, in such a way that disable call waiting tone produces all the call waiting tones are muted.

Feature Activation

For this purpose, a new parameter has been included in section [sip] of common or MAC config files. So, you can enable or disable call waiting tone setting to 0 or 1, respectively. Default value is 0.

```
[sip]
```

```
...
```

```
DisableCWtone=0 (the call waiting tone is played)
```

```
DisableCWtone=1 (the call waiting tone is not played)
```

```
...
```

The activation of this feature is also accessible from the Web Gui in the Advanced | Call Features section.

Soft keys reordering

Up to now, the soft keys position was fixed. If you removed a soft key (by web GUI or APS), its position remained empty. So you could have 2 soft keys on the first page, another one on the second...

In order to avoid this situation, soft key reordering is possible since this version.

Also it could be interesting to put on the first page the most useful soft keys.

Feature Activation

The reordering of the soft keys only can be configured using APS. The soft keys order is indicated in section [sys] of common or MAC config files. Each function or service is associated to a soft key. It is the administrator responsibility to ensure a function is not used twice or is missing.

The function names syntax is independent from the language table. In case the function name is modified in any language, the above syntax must remain unchanged.

Following the country language selected, the corresponding wording will be displayed.

The following list has to be added to common or MAC file to determine the order:

```
[sys]
...
softkey01=TrVoiceMail
softkey02=CallLog
softkey03=PickUp
softkey04=LockPhone
softkey05=VoiceMail
softkey06=RetrievePark
softkey07=DNDstate
softkey08=ShortCut1
softkey09=ShortCut2
softkey10=ACDCheckIn
softkey11=ACDAvailable
softkey12=Login
...
```

Defined soft keys location is displayed on MMI screen as follow:

Date	Hour	Icons
Phone Name		
Phone Number		
< Softkey1	Softkey2	Softkey3 >
< Softkey4	Softkey5	Softkey6 >
< Softkey7	Softkey8	Softkey9 >
< Softkey10	Softkey11	Softkey12 >

Early Media Type parameter

Regarding Early media and RTP, policy so far was: 18x with sdp triggers RTP to be played, whereas 180 ringing without sdp triggers local ringing signal generation.

Some systems however have been found with call flows incompatible with this policy.

For this reason, a parameter has been created in order to decide whether a 180Ringing will generate local ringing or will continue playing RTP previously negotiated in the early session.

New parameter is `Earlymediatype`. See below in order to know how to configure it.

Feature Activation

This parameter can be configured using APS through common and MAC config files, where you can find `Earlymediatype` in section `[sip]`. It can be also modified via telnet using command `sip set early_media_type`.

Default value is 0. That means phone will switch to local ring tone if it receives a 180 Ringing (no sdp) response, regardless if an RTP stream corresponding to the early media session is present.

Setting `Earlymediatype` parameter to 1, phone will continue playing RTP stream corresponding to the early media session even if a 180 Ringing (no sdp) response is received.

```
[sip]
...
Earlmediatype=0 (switch to local ringing generation
                  if 180 (no sdp) is received)
...
```

Or

```
[sip]
...
Earlymediatype=1 (do not switch to local ringing if 180 (no sdp) is
                  received, and still playing the incoming RTP pkg)
...
```

Login/Logout

Login/Logout feature allows the user to register easily with his own parameters (username and password) on any TB30S in a location.

A Registration Event server as described by RFC3680 (A Session Initiation Protocol (SIP) Event Package for Registrations) is needed for this feature to work. Interested parties can ask for a complete specification of this service to their technical customer support.

There are two different applications for login/logout: substitution and free sitting. In Substitution scenario, user will be able to login on any phone on the same network in order to get, for a while, the rights allowed to your telephone line (ie: external calls, international calls, your remote phone book ...). Free-sitting is a typical application in call-centers. When the employee arrives at work, he takes place in front of any free phone; he presses login key on the TB30S then enters his login and password.

When this feature is enabled, behaviour will depend on active SIP profile as follows.

In Substitution scenario, phones have one active profile which they will normally use (can be profiles 1, 2 or 3), plus a backup profile for emergency which is profile 4. In Free-sitting scenario, phones have as active profile the profile 4. This profile will be populated with emergency account information, which they will use while no dynamic personal profile is active.

The login function allows the phone to register (and/or authenticate) on a SIP server with two parameters: username and password. The parameter username is common to the fields "Phone Number", "Phone Name" and "Authentication ID". The parameter password is the same as the "Password" field. Each user must have his own parameters.

The logout function allows the phone to return to its initial profile, recovering the user his static personal profile in case of phone is in substitution scenario or the backup profile if phone is in free-sitting scenario.

Feature activation

This feature can be configured via APS setting to 1 ManualLog parameter and adding the user part of the registration events server uri in RegEventServer parameter in common or MAC file:

```
[ipp]
...
ManualLog=1
...

[sip]
...
RegEventServer=MyRegEventServer
...
```

Or via Web GUI in section "Advanced | Voice Settings | Advanced" where it is necessary to enable Support manual login-logout to fill RegEventServer field. This field contains the user part of the registration events server uri, and the domain is automatically added when you enter Domain Name Server in the active profile.

Broadsoft Shared Call Appearance

This new feature makes the phone compatible with Broadsoft Shared Call Appearance facility.

This function allows several users to share a phone number (the one in the active SIP profile), so that they can receive the same calls, make a call from the same number, unhold a previously held call, or even conference.

For incoming calls, all the phones with this service active (SCAs from now on) will ring simultaneously and the first picking up will catch the call.

For outgoing, the SCA will take the line, if available, by sending a subscription and the caller number is the same independent of which SCA is doing the call.

In order to support this, the phone establishes 2 new kind of subscriptions: event=line-seize and event=call-info. The first is for taking the (shared) line and the second to be informed about the status of this (shared) line: idle, seized, progressing, active, held, held-private, bridged-active and bridge-held.

Enriched Display

A new screen and some softkeys are available specifically for this feature.

The screen shows the status of the shared line: as soon as there is an active call in any of the phones using the same Shared Call Appearance (SCAs), it will be launched in the rest of them and refreshed when any change in the state of this call occurs.

The softkeys are:

"Retriv": retrieve selected call appearance which is in Held state.

"BargIn": barge in selected call appearance which is in Active/Bridge-Active/Bridge-Held state. After that, we'll have a 3-way call between the initial shared call appearance, the phone which did the Barg-In and the remote party.

"NewCal": make a new call

"Back": cancel the display of call appearance(S) state and back to previous state.

Feature activation

To activate Shared Call Appearance user just have to click on the SCA flag in Advanced->Call feature menu in the Web GUI:

Or by APS in [sip] section of both Common or Specific-MAC config files with the new parameter SharedCallAppearance (0 by default, inactive; 1 to active):

```
[sip]
...
SharedCallAppearance=1
...
```

The rest of the configuration will be done by your BroadSoft accounts administrator.

Automatic Hang Up

This new feature allows the phone to hang up automatically, stopping the audio output (regardless it's from speaker, headset or handset) and turning the phone into idle state. It can be configured to wait x seconds before the hang up is done. If the value of x is set to 0, phone understands that this feature is deactivated.

Obviously this doesn't enter in conflict with the signalling since the count of seconds starts after a BYE is received.

If the phone hangs-up automatically and the handset is not physically on-hook, on the next incoming call the user must on-hook first then off hook to answer the call (or press the Answer softkey).

Feature activation

It can be configured via Web GUI with a new parameter sitted on Advanced | Avanced menu:

Or by the Autoprovisioning with the parameter AutoHangUp in the [ipp] section of APS config files (both Common or specifi-MAC):

```
[ipp]
...
AutoHangUpTimer = 3
...
```

In both cases, via Web and via Autoprovisioning, the behaviour is the same. User introduces the number of seconds he wants the phone to wait (after the BYE) for hanging up; 0 to deactivate.

Call Park Type

This is not exactly a new feature but a new way of supporting traditional Call Park and Park Retrieve. From now on there are 2 modes for implementing them: The first (set by default) is the one recommended by draft-sipping-service-examples and the other one is quite similar to a blind transfer. The latter was already supported as unique Call Park/Retrieve method in TB30SI versions.

Call Park/Retrieve Park implementation modes

Both modes requires a proper enviroment that supports Call Park.

Mode 0:

Call park is achieved by TB30 sending a REFER message to the park extension with

- Request-URI: the park extension
- Refer-to: the party which is going to be parked
- Replaces (param inside Refer-to header): dialog between parked and the one who parks.

Retrieve Park is achieved by TB30 sending a SUBSCRIBE message to the park extension and then, when park answers a NOTIFY with the dialog identifiers, it has to send an INVITE (with Replaces header) again to the previously parked party.

Mode 1:

Call park is achieved by TB30 sending a REFER message to the other party equal to the one sent if a blind transfer to the Park extension was done. Park Retrieve is achieved by TB30 sending an INVITE message to the park extension. This one will manage the rest of signalling to finalize the retrieve.

Also in both cases, park extension is configured as it used to be, by the proper option in Advanced | Call Features menu in Web GUI.

Feature activation

This feature can only be set by Autoprovisioning with the parameter Call_park_type in [sip] section of the config files (both common and specific-MAC):

```
[sip]
```

```
...
```

```
CallParkType=0 (default value. Mode 1 is activated with value 1)
```

```
...
```

Ringer in the headset.

The ringer shall always be audible in the headset whatever the ringer level selected on the loudspeaker.

The volume of the ringer in the headset follows the headset volume setting.

Feature activation

This is always active; it's a new behavior rather than a feature. Just pressing the volume keys when headset is active will adjust the volume for the rest of the current call and for the nexts, also the ringer volume, until next change.

Ringer Off

Now it's possible to turn off the ringer on the loudspeaker. There are 9 steps currently and the lowest step turns off the ringer.

Feature activation

This is always active; it's a new behavior rather than a feature. Just pressing the volume keys when TB30 is ringing will adjust the volume for the rest of the current ringing and for the nexts, until next change.

Ignoring Firmware update

In the INF file, if the name of the Firmware starts with the letter X (lower or upper case) or is empty, the IP Phone is ignoring this parameter and keep using its old Firmware. Moreover, the IP Phone doesn't display an error message because of this.

However, if the Telconf or config files are not compatible with this old firmware, an error message will be displayed.

Call-info header with Answer-after parameter

This new feature allows the phone to answer a call automatically and in handsfree mode if the phone is on-hook which is comfortable for the user since he doesn't have to take any action to be able to speak.

But this already existed in previous versions as a local feature of the phone. The main difference of this new supported parameter is that the automatic answer is indicated by the server for a particular call, not by the user and for all calls. This new behavior is used by some servers (e.g: BroadSoft) to implement Click-to-call facility where the party that appears in the call as "From" URI shouldn't ring as the "To" does.

Feature activation

It can't be activated or deactivated. This new supported feature doesn't enter in conflict with any other. It's implicitly activated when receiving and INVITE of this kind:

```
INVITE sip:123456789@broadworks.net SIP/2.0
From: <sip:jamie@broadworks.net>; tag=1
To: <sip:foo@broadworks.net>
Call-Info: <sip:broadworks.net>; answer-after=0
```

The Call-Info header field provides additional information about the caller or callee, depending on whether it is found in a request or response. To support intercom and click-to-call scenarios, we introduce a parameter called "answer-after". When present in the Call-Info header of an incoming INVITE request, it indicates how many seconds should be waited by the UAS before the call is automatically answered.

If the "answer-after" value is 0, then the call should be automatically answered without applying any alert tones. If it's 1,2,3... then phone will ring 1,2,3... seconds before the call is answered.

Network Conference

This is not exactly a new feature but it's a new way of supporting traditional Conference (called Local Conference from now on).

Network conference allows the phone to be interoperable with servers that are able (and prefer) to carry out the conference by themselves.

Feature activation

This feature can be configured via web with a new flag:

or by the APS files with a new parameter in Config Files (either common.txt or mac.txt):

ConferenceMode=0 (Local is the default mode) or 1 (for Network Conference)

Which is placed in [sip] section and set to 0 by default.

Managing Network Conference

With Network Conference activated phone is registered a bit different: REGISTER sent has to include in Allow-Events a new one called Conference:

```
...
Allow-Events:refer,dialog,message-summary,check-sync,talk,hold,conference
...
```

After that, when initiating a Conference (by Conf or Join softkeys, same as traditional Local Conference) the phone just have to send a NOTIFY (event: conference) containing in its Refer-to header, location info of the 3rd, 4th, 5th... party that it wants to add to the conversation. Server will send the proper INVITES and BYES (or any other message) to complete the Conference.

Of course when Local Conference is the one activated, phone behaviour is the same as in previous versions.

Configurable Refer-To header population

The purpose of this feature is being able to populate Refer-To header with two different (but similar in concept) information. This is thought for Attended Transfer where refer-to header included in REFER message has to contain the URI of the target.

This will have to be configured in the phone which transfers (transferor) and allows it to be compatible with more servers in what is related to Attended Transference.

The two options are:

1. Populating it with the Request -URI of the messages sent to this target (e.g: INVITE sent by transferor to the target in what we call Consultative call)
2. Populating it with the Contact info of the target. This is obtained by the transferor analyzing Responses of the requests sent to the target (e.g: 200 OK answered in already mentioned Consultative call)

Feature activation

For option 2 (recommended by RFCs) the Flag has to be activated and for option 1 deactivated.

In this example, option 1 has been configured via web:

In APS config files (common and mac) this issue will be configured using the parameter `TransferUseContact=1` (flag ON) or `0` (flag OFF)
Which is placed in [sip] section and set to 1 by default

Check phonebook Domain name

For users who use to registered the phone in different accounts, with different servers or at least domain names, this can be use to get more freedom of action when storing numbers in phonebook.

There is a flag which can be activated or deactivated and basically decides if the phone will check the domain name or just the user part to recognise phonebook entries (both on incoming and outgoing calls)

Feature activation

It can be set via web:

Or by APS, with a new parameter `Check_phonebook_domain_name=1` (or 0 to deactivate) included in config files (common or MAC). Exactly in [ipp] section and having 1 as default value

Phonebook entries recognition

Behaviour of the phone related to this option can be resumed in this points (points 3 and 4 are interesting but independent of this new flag):

- 1.- Call from/to 1234(@my_domain) will be recognised by phone as phonebook entry 1234@any_domain, showing its assigned name<=>Flag inactive
- 2.-Call from/to 1234(@my_domain) will JUST be recognised by phone as phonebook entry 1234@my_domain, showing its assigned name<=>Flag active
- 3.- Phonebook entry stored as 1234 (no domain included) will always be recognised, showing assigned name, both in incoming calls and outgoing for any state of the flag.
- 4.- Also for any flag state, INVITEs to phonebook entries type name@domain will be launched with that domain and type name (no domain included) will go with current registered domain

APS improvement

TelConf file will only be downloaded if its name has changed from the previous downloaded one.

Changes in APS are deeply explained in several documents in APS&FW upgrade of this Release package.

Talk and hold event packages for click-to-answer and other 3PCC scenarios

This extension provides the ability for an Application Server to send an asynchronous NOTIFY event to our phone, using an existing INVITE dialog. This will allow an user responds hold and unhold a call from an application in a PC (e.g: Broadsoft Call Manager) without touching any key in the phone.

When a UAC sends an INVITE to a UAS, it adds an Allow-Events header to the request, indicating all of the event packages it supports. When a UAS responds to the INVITE with an 18x provisional response or a 200 OK response, it adds an Allow-Events header indicating all of the event packages it supports.

Talk event

The Allow-Events header in the 180 Ringing indicates to the Application Server that our phone supports remote call control primitives. When the user (e.g: handling a PC) selects the incoming call and clicks on "talk" – an event is sent from the call client to the Application Server, indicating that the user is requesting that the incoming call be answered. The Application Server reacts by sending a NOTIFY to the SIP phone.

The IP phone indicates that it honors the request by responding to the NOTIFY with a 200 OK. The phone then automatically answers the incoming call by forcing off-hook and activating the speaker.

Hold event

The call is set up as usual. Now the user at the call client decides to remotely hold the call and sends a "hold" request to the Application Server. The Application Server discovered that the endpoint supported the hold event package through an Allow-Events header in the 180 Ringing provisional response.

The Application Server reacts by sending a NOTIFY with a hold event. Note that this NOTIFY is sent using the same dialog as the session it is acting on.

Persistent VLAN

This is an improvement in VLAN configuration via DHCP. This is deeply explained in VLAN provisioning via DHCP.pdf placed in the same folder as this.

User Class Identifier

User Class identifier is a DHCP option (Opt 77) which allows DHCP servers to serve different devices differently.

In particular, this option is useful for Provisioning scenarios with more than one model using a similar strategy for provisioning parameter transport using options 66/67/150.

TB30 will send option 77 in all DHCP DISCOVER and DHCP REQUEST messages.

The content delivered by TB30 within this option depends on the protocol loaded.

Hence it will be "Thomson TB30S" or "Thomson TB30M"

As an example, this is what would be seen with a packet sniffer with an SG version

The screenshot shows the Wireshark interface with a DHCP transaction selected. The packet list pane shows four packets: 473 (DHCP Discover), 474 (DHCP Offer), 475 (DHCP Request), and 476 (DHCP ACK). The details pane for packet 475 shows the following options:

- 3 = Router
- 6 = Domain Name Server
- 66 = TFTP Server Name
- 67 = Bootfile name
- 43 = Vendor-Specific Information
- 190 = Private
- 191 = Private
- 192 = Private
- 42 = Network Time Protocol Servers
- 150 = Private
- Option 60: Vendor class identifier = "001\Thomson\002\006ST2030\003\003SIP\004\0013\005\00200\006\00215"
- Option 61: Client identifier
 - Hardware type: Ethernet
 - Client MAC address: 00:0e:50:4e:5a:56 (00:0e:50:4e:5a:56)
- Option 77: User Class Information (15 bytes)
- End Option

The hex dump pane shows the raw data for the User Class Information option (0170-0174):

```

0170 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00
0171 31 35 3d 07 01 00 0e 50 4e 5a 56 4d 0f 54 68 6f
0172 15 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00
0173 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00
0174 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00 00
    
```

The filter bar shows 'bootp' and the packet count is 492.

Feature activation

This feature is always active and does not need any configuration.

Additional Softkey Control

The purpose of this feature is being able to deactivate/activate “Transfer to voice mail” and “Pick up” soft keys, to accomodate to environments in which these features are not supported.

Feature activation

Web GUI and APS can be used to control these features.

In the admin Web GUI, go to Advanced → Call Feature page, 2 new entries can be found:

“Transfer to voice mail” corresponding to “TrMail” soft key
 “Pick up call on another phone” corresponding to “PickUp” soft key

You can tick/untick the options to enable/disable the features. They are enabled by default

As for APS, related parameters are described in next paragraph.

Keyword definition and usage

The parameters governing this feature, included in the [ipp] section, are:

Transfer_to_voice_mail

Values : 0 or 1

Meaning :

0 : Transfer to Voicemail softkey will not appear on phone screen

1 : Transfer to Voicemail softkey will appear on phone screen

Default: default value is “1”

Pick_up_call

Values : 0 or 1

Meaning :

0 : Call Pickup function is disabled. Softkey will not appear on phone screen

1 : Call Pickup function is enabled. Softkey will appear on phone screen

Default: default value is “1”

Example:

```
[ipp]
Transfer_to_voice_mail=1
Pick_up_call=0
```

Call Progress Indication Control

For environments in which early media is provided, e.g. to convey network progress tones, the status information shown on the display of the phone may in some cases result confusing.

For example, when you receive a busy tone via early media, and the phone shows “Ringing”, according to its call progress status.

To overcome this situation, a control flag is provided to administrators. So, they may decide whether to show call progress indication in this early state.

Feature activation

APS is currently used to control this setting.

Involved APSparameter is described in next paragraph.

Keyword definition and usage

The parameter governing this feature, included in the [ipp] section, is:

Disable_call_progress

Values : 0 or 1

Meaning :

0 : Progress indication in early state is shown

1 : Progress indication in early state is not shown

Default : 0 (Progress is indicated)

Example :

```
[ipp]
Disable_call_progress=1
```

Phone Number Display in Idle Mode Control

TB30 idle screen shows both display name and user part of the sip uri in the active account (phone number).

In some systems, however, the phone number has some additional characters like MAC address, for example, which makes the screen look unfriendly to users.

An option has been implemented to be able to hide phone number in idle screen.

Feature activation

APS is currently used to control this setting.

Involved APSparameter is described in next paragraph.

Keyword definition and usage

The parameter governing this feature, included in the [ipp] section, is:

Hide_Phone_Number_Display

Values : 0, 1

Meaning :

0 : the phone displays its phone number on the idle screen

1 :: the phone does not display its phone number on the idle screen

Default : 0 (number is displayed)

Example :

```
[ipp]
Hide_Phone_Number_Display=1
```

Automatic call when offhook

The purpose of this feature is to allow the user to call a number that is pre-registered in the phone. The call will be placed as it is unhooked (when you use handset, headset or handsfree). This behaviour will remain the same as long as it is not disabled by APS.

This functionality can be used to emit emergency calls. In this case, the user is directly directed towards an urgent number when he pickups the phone.

For example, this can be used in an elevator which is blocked.

Feature activation

APS is currently used to activate/deactivate this feature, via the parameters described in next paragraph.

Keyword definition and usage

The parameters governing this feature, both included in the [ipp] section, are:

Autocall

Values : 0 or 1

Meaning :

0 : Autocall feature is disabled

1 : Autocall feature is enabled

AutocallNumber

Value : character string

Meaning : the string represents the phone number or URI to be called

Example:

```
[ipp]
Autocall=1
AutocallNumber=0805
```

Hide Missed Calls flag

The purpose of this feature is being able to deactivate/activate Missed Calls message display on the phone screen.

This will have mainly interest within the framework of call centres in which calls are sent to all Agents and only picked up by one of them, whereas it is not desirable to have all other phones of the group announcing a missed call.

Feature activation

APS is currently used to activate/deactivate this feature, via the parameter described in next paragraph.

Keyword definition and usage

The parameter governing this feature, included in the [ipp] section, is:

HideMissedCall

Values : 0 or 1

Meaning :

0 : Missed Calls message will be displayed

1 : Missed Calls message will not be displayed

Example :

```
[ipp]
HideMissedCall=1
```

Autoanswer device routing

The purpose of this feature is being able to select which audio devices will be activated when Autoanswer feature is enabled.

In previous versions, default device was handsfree speaker/mic. In Call Centre environments it makes more sense to use headset for this purpose.

Feature activation

Web GUI or APS are currently used to control this feature. Please note the Autoanswer timer must be different from 0 for Autoanswer to be activated.

In the web gui, go to Advanced→Advanced section

Keyword definition and usage

The parameter governing this feature, included in the [ipp] section, is:

AutoAnsMode

Values : 0 or 1

Meaning :

0 : Autoanswered call routed to handsfree

1 : Autoanswered call routed to headset

Example:

```
[ipp]
AutoAnsMode=1
AutoAnsTimer=2
```

Daylight saving refinements

In previous TB30 versions, parameter NtpDaylight exists in order to allow the telephone to automatically switch to summer-time.

But some states in some countries have a particular and varying switching time which makes it difficult to handle internally on a global basis.

In order to overcome this problem, a new value for the existing parameter is created. When this setting is in place, phone will add one hour to NTP received time.

Feature activation

Web GUI or APS are currently used to control this setting.
In the Web GUI, go to Advanced→SNTP section:

Involved APSarameters are described in next paragraph.

Keyword definition and usage

The parameter governing this feature, included in the [ntp] section, is:

NtpDaylight

Values : 0, 1 or 2

Meaning :

- 0 : NTP time unchanged
- 1 : Automatic Daylight saving applied to NTP time
- 2 : NTP +1

Example :

```
[ntp]
NTPFlag=1
NtpIP=192.43.244.18
NtpDaylight=2
NtpZoneNum=50
NtpSyncTime=1
```

NTP address source configuration

In previous TB30 versions, NTP server address was either taken from the DHCP server, or from stored values if DHCP server was not serving this parameter.

This feature allows the administrator to decide which will be the source of NTP address.

Feature activation

APS is currently used to control this setting.

Keyword definition and usage

The parameter governing this feature, included in the [ntp] section, is:

NtpMode

Values : 0, 1

Meaning :

0 : NTP address retrieved from stored value

1 : NTP address retrieved preferably from DHCP server

Example :

```
[ntp]
NTPFlag=1
NtpIP=192.43.244.18
NtpDaylight=1
NtpMode=0
NtpZoneNum=50
NtpSyncTime=1
```

Information shortcut-“Menu” long press

The purpose of this feature is to facilitate Support tasks, by granting fast access to basic phone information: HW and FW version, MAC and IP address, etc

This information was already provided by pressing User→Information
Now, access to this submenu is also available by long pressing “Menu” key

TB30 SIP Distinctive ringing and CWT using <Alert-Info> header

This section describes how TB30 uses <Alert-Info> SIP header in INVITE requests for distinctive ringing and distinctive CWT (Call waiting tone) features.

<Alert-Info> Header and Ringing management

This section specifies how the TB30 SIP handles the <Alert-Info> header and parameters in SIP when the phone is in idle state, i.e., no other call is currently active.

System ringers

When TB30 is asked to play a ringer it should look for it within previously downloaded system ringers.

Example:

Alert-Info: MyMelody8 will trigger "MyMelody8" (system)

Void or not understood Alert-Info

When TB30 receives a void or not understood <Alert-Info> header, it plays a default Distinctive ringing melody which is not configurable.

Example of a void Alert-Info:

Alert-Info: will trigger Default Distinctive ringing melody

Example of not understood (unable to play):

Alert-Info: <http://music.com/boom.mp3>

Alert-Info: Toto if there is no "Toto" ringer downloaded.

Alert-Info with local URL

When TB30 receives a Alert-Info with a local URL 127.0.0.1 as argument, it plays the ringers named as the character string following "http://127.0.0.1/"

Example of Alert-Info with local URL:

Alert-Info: <http://127.0.0.1/MyMelody5> will trigger "MyMelody5"

Alert-Info with URN

When TB30 receives a Alert-Info targeting a URN designating a local melody, it plays the ringers named as the character string received.

Example of Alert-Info with URN:

Alert-Info: MyMelody8 - will trigger "MyMelody8"

Alert-Info with info parameter

When TB30 receives a Alert-Info with an info parameter specified, it plays the ringers named as the character string received in the info parameter.

Example of Alert-Info with info parameter:

Alert-Info: <http://www.notused.com>;info=MyMelody9 - will trigger "MyMelody9"

<Alert-Info> Header and Call Waiting Tones management

This section specifies how the TB30 SIP handles the <Alert-Info> header and parameters in SIP when the phone has already an active call. In this case, the header will determine which Call Waiting tone will be played.

Description

The same behaviour as in chapter 1 will be applied. The difference is the phone will look for the tones within previously downloaded Call Waiting Tones instead.

In case the header is not understood or no match is found with downloaded tones, default tone will be applied.

System melodies and Call Waiting Tones download

Melodies are described using RTTTL files as documented in the Admin Guide. There are two ways to download files including System Melodies and Call Waiting tones to TB30:

Web GUI (admin): section Advanced → System Melody or Advanced → CWT Melody. The management in this sections is exactly the same as in Melody Management, described in the Admin Guide.

APS: file names can be included in the information file (*.inf) within the parameters:

**system_melodies=
call_waiting_tone=**

in [config] section.

Please check TB30-AutoProvisioning-VXXXXX.pdf for details.

Some examples of melodies and call waiting tones, and their usage within an .inf file can be found in this release package, "APS sample files" folder.

Part 11 - Remote Phonebook Specification

1. Description of the service

The aim of this service is to provide an easy access to the company's phonebook through the TB30 Phone. The final user enters the name of the person he wishes to call on the telephone, using the DTMF keys. The telephone then consults an external server (using HTTP/XML), and displays the entries that matches the name entered. The user can then select one of them, and initiate a call. The user can consult the phonebook when the telephone is idle, but also when he is engaged in a conversation.

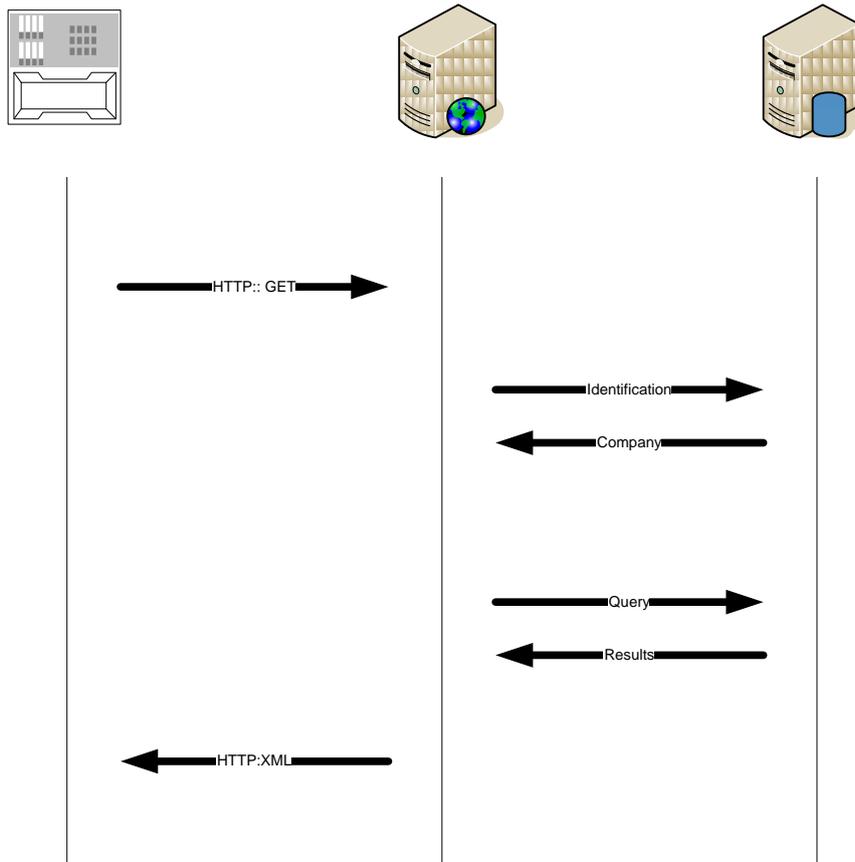

Example:

1. The User enters “Dup” as a search string
2. The phone displays 2 results “Dupond” and “Dupont”
3. The user selects Dupont
4. The phone displays the telephone number of Dupont
5. The user chooses to call Dupont
6. The phone places the call

2. Server specifications

2.1 General structure

The phone sends the search string to the *HTTP* server by sending a HTTP “*Get*” request. The server identifies the phone, and then searches in a database all the matches to this query, in the companies in which the telephone is. The server then sends back a XML page to the telephone, which will contain the results of the query.

2.2 Phone query

The TB30 is able to send several parameters to the server in the *GET* request:

Parameter	Description
#IP	IP address of the phone
#MAC	MAC address of the phone
#SEARCH	The string to search (most likely the first letters of the last name of the person we want to lookup the telephone number)

Some of those parameters will be sent by the telephone in the query request. Here is an example of an HTTP request that would be sent by the phone in order to lookup in the phonebook all the names that start by “Dup”.

http://www.server.com/search.php?IP_ADDR=192.168.1.23&MAC_ADDR=000590024f3e&NAME=Dup

2.3 XML Tags used by TB30

```

<ThomsonPhoneBook>
</ ThomsonPhoneBook>
    
```

```
<DirectoryEntry>
</DirectoryEntry>
```

```
<Name>
</Name>
```

```
<Telephone>
</Telephone>
```

See following paragraphs for some examples.

2.4 Answer to the request from the server

2.4.1 No answers

If the server doesn't find any answers to the result of the query, it will send back to the phone this XML page:

[ThomsonPhoneBook XML page]

```
<ThomsonPhoneBook>
</ ThomsonPhoneBook>
```

2.4.2 Less than 32 results to the query

If the server finds less than 32 answers to the query, it should send to the telephone this kind of XML page:

[ThomsonPhoneBook XML page]

```
<ThomsonPhoneBook>
  <DirectoryEntry>
    <Name>Dupad André</Name>
    <Telephone>0175008348</Telephone>
  </DirectoryEntry>
  ....
  <DirectoryEntry>
    <Name>Dupont Antoine</Name>
    <Telephone>0175008338</Telephone>
  </DirectoryEntry>
</ ThomsonPhoneBook>
```

2.4.3 More than 32 results to the query

If the server finds more than 32 answers, the phone won't be able to displays all the results at once. This is why the server won't send all the answers back to the telephone. He will instead send a list of URLs, where the phone will be able to fetch the results by block of 32 entries.

[ThomsonPhoneMenu XML page]

```
<ThomsonPhoneMenu>
  <MenuItem>
    <Name>Arrh → Foulard</Name>
    <URL>http://www.server.com/get32results\_1.php</URL>
  </MenuItem>
  ....
  <MenuItem>
    <Name>Roger → Ziad </Name>
    <URL>http://www.server.com/get32results\_7.php</URL>
  </MenuItem>
</ ThomsonPhoneMenu>
```

Each URL in the menu will send back a *ThomsonPhoneBook* XML page as described in the previous section.

3. TB30 Phone Specifications

3.1 Presentation

The TB30 will be able to send the queries to the HTTP server, and display the XML pages sent back from the server, and enable the user to navigate in simple menus, in order to select an entry, view the number, and call the contact.

3.2 Configuration

The URL of the query CGI that has to be called in order to perform a search in the phonebooks must be specified in the configuration file of the TB30. They are written in the following way:

http://www.server.com/services/phonebook/search.php?IP_ADDR=#IP&MAC_ADDR=#MAC&NAME=#SEARCH

In those URLs if some pattern starting with the “#” character are found and they match some predefined strings, they are replaced by the corresponding values. Here are the conversions:

- #IP → replaced by the IP address in decimal. Ex: 192.68.0.1
- #MAC → replaced by the MAC address in hexa. Ex: 000E504EA77B
- #SEARCH → replaced by the entry of the search request. EX: dup

An example of config file:

[TB30s_common.txt]

```

...
Phonebook1_url =
http://www.server.com/services/phonebook1/search.php?IP\_ADDR=#IP
&NAME=#SEARCH
Phonebook1_name = Thomson Telecom
Phonebook2_url =
http://www.server1.com/pb/search.php?NAME=#SEARCH
Phonebook2_name = Inventel
Phonebook3_url =
http://www.server2.com/services/phonel/s.php?MAC\_ADDR#MAC&Name=#SEARCH
Phonebook3_name = Yellow pages
...
    
```

3.3 Cancel Key

At anytime, if the Cancel hard key is pressed, the phone returns to its IDLE mode.

3.4 Accessing the Phonebooks

3.4.1 MGCP

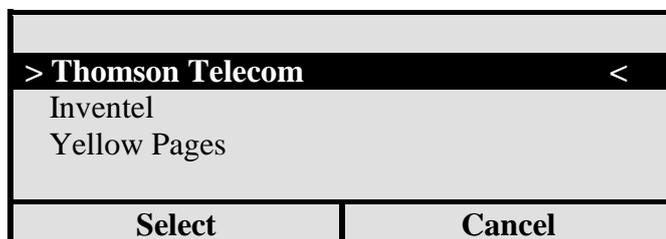

One phonebook

If only one phonebook is available (i.e. Phonebook2_url is empty), TB30 goes directly to the Query Menu.

Several phonebooks

If more than one phonebook is available (i.e. Phonebook2_url is set), TB30 goes to the Phonebook menu.

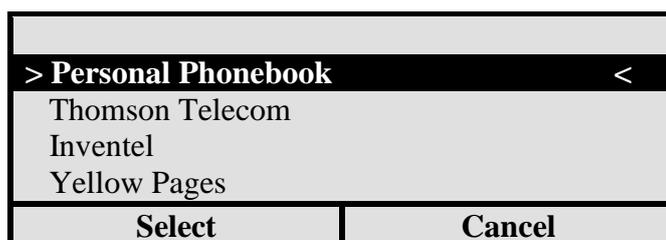

If the TB30 finds more than 1 phonebook in the config file, it displays the phone book names. The user is able to browse in the list of phonebooks using the *up* and *down* keys, and select one of them using a softkey or the *OK* button. He is of course also able to cancel his search.

3.4.2 SIP

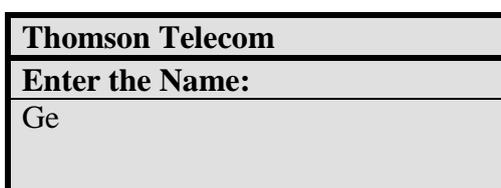

The PBX (or network) based phonebook(s) are displayed along with the Personal Phonebook that is inside the TB30.

The user will be able to browse in the list of phonebooks using the *up* and *down* keys, and select one of them using a softkey or the *OK* button. He will of course also be able to cancel his search.

3.5 Query Menu

When the user enters in the phonebook service, he is asked to enter the search query. He can enter the search string by using the DTMF keys, and can send or cancel the search with 2 softkeys.

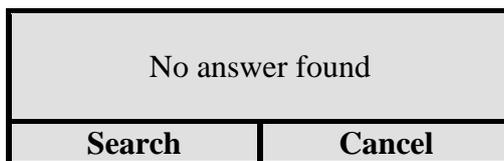

3.6 Incoming call during search

If the phone receives an incoming call anytime during the search, the search is cancelled and the phone shows up the call, in the same way as if it was in IDLE mode before the call arrives.

3.7 Displaying empty phonebook

If no results are found, the phone will receive an empty *ThomsonPhoneBook* XML page. The user will have the choice to search another string, or to abort.

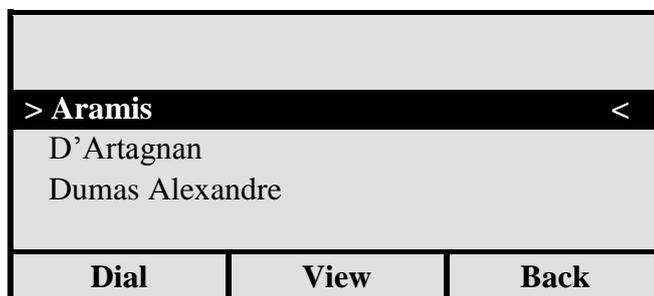

If the user selects “*Search*”, he will return to the previous menu.
 If the user selects “*Cancel*”, the phone goes back to IDLE mode.

3.8 Displaying less than 32 results phonebook

If less than 32 answers are found, the server will send back a *ThomsonPhoneBook* XML page, containing all the contacts’ information. The phone will display the names of the contact in a list.

The user will be able to browse the list of answer using the up and down keys. He will have 3 softkeys which will enable the user to directly call the contact, display his number, or go back to previous screen.

The phone displays in the list the content of the XML *Name* tag of each entry (XML *Directory XML*) of the list. If the *Dial* softkey or OK button is selected, the call is initiated. If the *Display* softkey is selected, the telephone number of the contact is displayed. If the *Cancel* softkey is selected, the user returns to the phonebook query page.

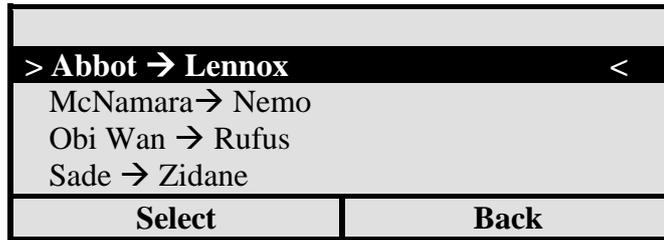

3.9 Displaying more than 32 results phonebook

If the server finds more than 32 entries to the query, it will not return all the answers, but will instead send a *ThomsonMenu* XML page, giving a list of URL. These URL will be used to fetch the results by blocks of 32 entries. The phone will display the menu sent by the server. The user

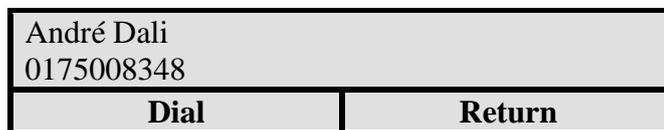

will be able to browse in the list of URLs using the *up* and *down* keys, and select one of them using a softkey or the *OK* button.

3.10 Displaying an entry in the phonebook

When the users choose to display the telephone number of a user, the phone will display on the screen the telephone number of this contact, and propose to call this contact. He will also propose to go back to the previous listing of the results of his query.

If the user selects the softkey *Dial*, the phone will initiate a call to this contact. If the return softkey is selected, the phone will display the previous page.

3.11 Calling an entry in the phonebook

When the users orders the phone to call a contact, the phone directly dial the number as if it was typed and validated on the keypad.

3.12 Timeout

If any request of the TB30 takes more than 5 seconds to be answered, TB30 will display an alert display “Service unavailable” during 2 seconds and then go to IDLE mode.

Note

To know more the installation of remote phone book, you can download the installation and Setup guide on:

www.thomsonbroadbandpartner.com

Part 12 Telnet Activation

Introduction

This part reviews and summarizes TB30 Telnet commands useful for remote management of the phone.

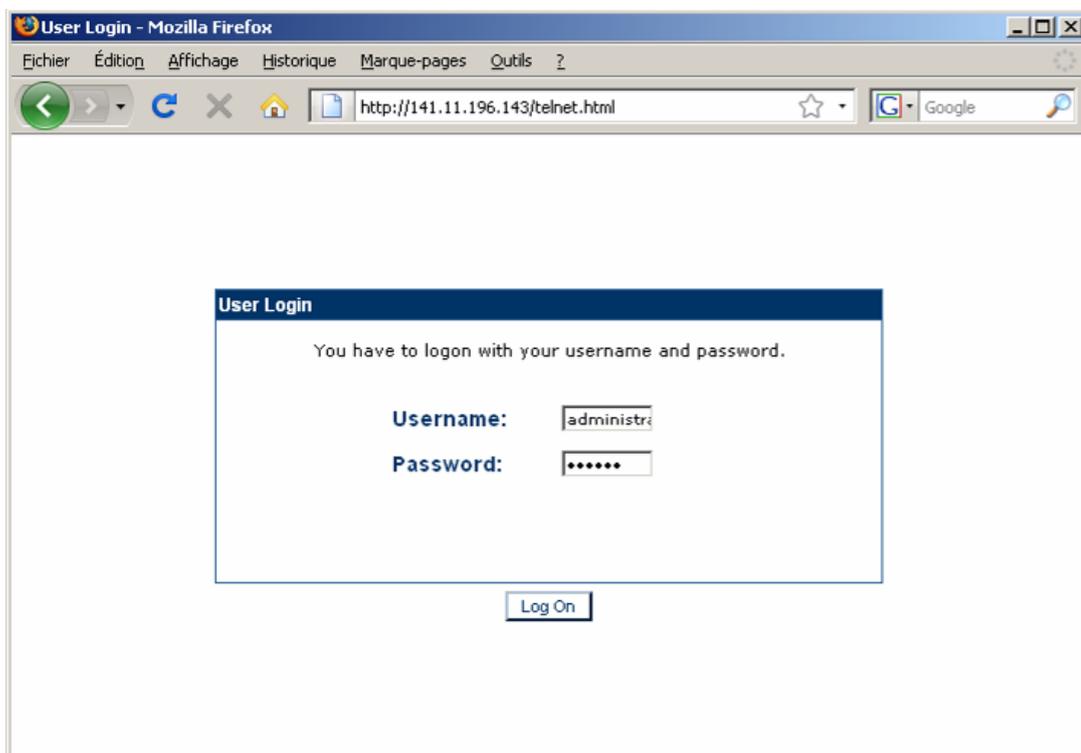

Other commands (like configuration of the phone's parameters) are described in another Technical document: "TB30 Config file Syntax". It is issued in the firmware release package.

Enable Telnet service

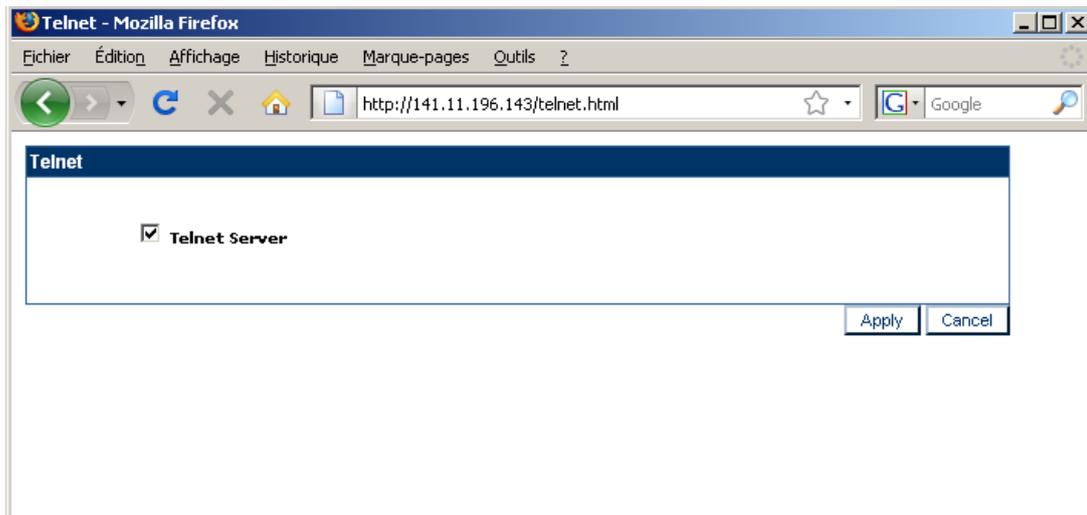

By default, the Telnet service is disabled for security reasons. So the Telnet service must be enabled before trying to open a telnet session on the phone.

Enter the following URL on you web browser:
`http://ip_address_of_the_phone/telnet.html`

Then enter the username and password (same as the web interface):
Username (default): administrator
Password (default): 784518

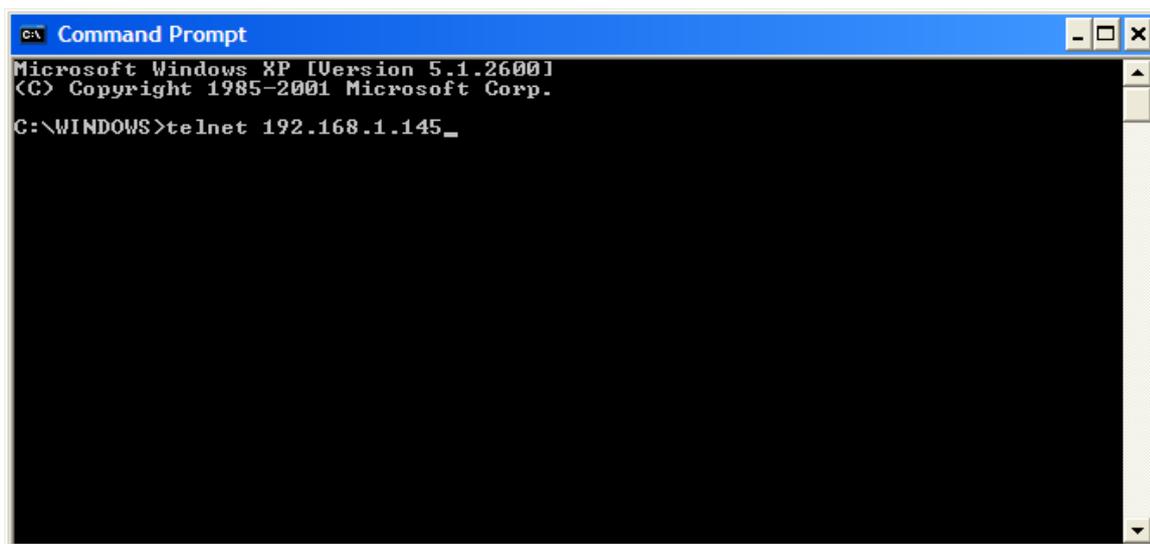

Then check the Telnet Server to activate it or uncheck the Telnet Server to disable it. Press Apply button to confirm the change.

Open a Telnet session

In Windows OS: Click on “Start” , select “Execute”, type “cmd” then press “Enter”
In the CMD window, type “telnet <ip address>”

Enter the username and password:
Login (default): administrator
Password (default): 789234

```

Telnet commands

The table below lists the telnet commands mainly focused on the remote management.

Command	Descriptions	Examples
Tftp	Upgrade Firmware tftp X.X.X.X filename [f/F] [TFTP server should be ready and select the corresponding directory]	[administrator]# tftp 192.168.1.3 v2030SG.080619.1.62.3.zz
Tftp2	Upgrade a number of defined files (See below) tftp2 telcfg X.X.X.X filename [f/F] tftp2 melody X.X.X.X filename tftp2 sys_melody X.X.X.X filename tftp2 cwt_melody X.X.X.X filename tftp2 listparms X.X.X.X filename tftp2 listlangtable X.X.X.X filename Language-index tftp2 langtable X.X.X.X filename tftp2 listtonetable X.X.X.X filename Country-index tftp2 tonetable X.X.X.X filename tftp2 listphonebook X.X.X.X filename tftp2 phonebook X.X.X.X filename	[administrator]# tftp2 sys_melody 192.168.1.3 tone-RG.txt

	<pre>tftp2 putimage X.X.X.X filename [f/F] tftp2 putfile X.X.X.X filename [f/F]</pre> <p>[TFTP server should be ready and select the corresponding directory]</p>	
Reboot	Trigger phone reboot	[administrator]# Reboot now
Activate	Enable services	[administrator]# Activate
Commit	Save settings	[administrator]# commit
Version	Show boot, dsp and FW version	[administrator]# Version
Info	Show phone info	[administrator]# info
sip show reg	Show registrar info	[administrator]# sip show reg
Ping	<p>Ping the specified Host</p> <pre>ping <X.X.X.X> [-t -n <Count>]</pre>	[administrator]# ping 192.168.1.3

Reset to default

Use the following procedure to reset the phone to factory default settings

Commands	Description	Example
<pre>sys set rel 0 ffs format ffs commit ffs commit flash clean nmm reboot immediate</pre>	Reset to default	<pre>[administrator]# sys set rel 0 [administrator]# ffs format [administrator]# ffs commit [administrator]# ffs commit [administrator]# flash clean nmm [administrator]# reboot immediate</pre>

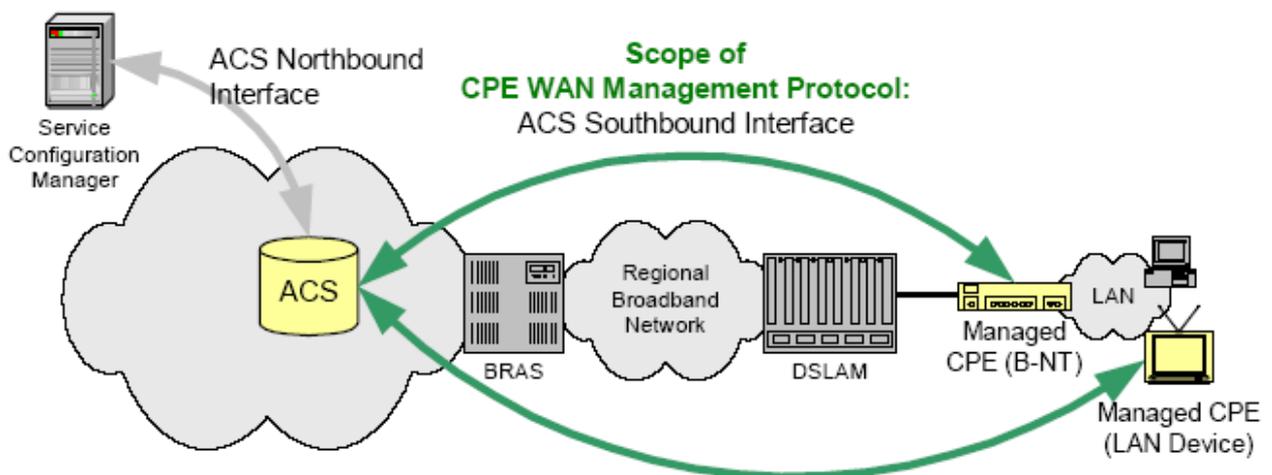

Part 13 TR069 & TR111

Purpose

VOIP phone TB30 support TR069, TR111 and its data structure TR104, TR106. This document has brief description of this new generation network management and focus on the FW download RPC.

Introduction

TR-069 is a standard for remote management of CPE (Customer Premises Equipment) defined by the DSL Broadband Forum. TR-069 uses common transport mechanisms (HTTP and HTTPS) for communication with CPE. The HTTP(S) messages contain XML-RPC methods defined in the standard for configuration and management of the device.

Typically on router on customer premises provides Internet connectivity to many phones as indicated in Figure 1. The ACS can now manage the router and all phones located behind it remotely.

The CPE WAN Management Protocol is intended to support a variety of functionalities to manage a collection of CPEs lie in LAN through WAN. It provides the following main capability :

- Auto-Configuration and Dynamic Service Provisioning

The protocol allows an ACS to provision a CPE or collection of CPE based on a variety of criteria. The provisioning mechanism includes specific provisioning parameters and a general mechanism for adding vendor-specific provisioning capabilities as needed.

- Software/Firmware Image Management

The CPE WAN Management Protocol provides tools to manage downloading of CPE **software/firmware image** files. The protocol provides mechanisms for version identification, file download initiation (ACS initiated downloads and optional CPE initiated downloads), and notification of the ACS of the success or failure of a file download.

- Status and Performance Monitoring

The protocol provides support for a CPE to make available information that the ACS may use to monitor the CPE’s status and performance statistics. The protocol defines a common set of such parameters, and provides a standard syntax for vendors to define additional non-standard

- Diagnostics

The protocol provides support for a CPE to make available information that the ACS may use to diagnose **connectivity** or **service issues**. The protocol defines a common set of such parameters and a general mechanism for adding vendor-specific diagnostic capabilities.

CPE Configure Settings

Webpage

Not all configure can be set via webpate. Please refer below illustrate.

1. Entering the webpage of the phone <http://x.x.x.x/admin.html>
2. enter ADVANCE=>CWMP(TR-069) webpagepage
3. CWMP(TR-69): enable/disable TR069 fouction.
4. Auto Configuration Server:
5. ACS User Name/ACS Password:
6. Inform Interval:

The screenshot shows the 'ADVANCED' configuration page for 'CWMP(TR-069)'. The interface includes a top navigation bar with 'HOME', 'SETUP', 'ADVANCED', 'UTILITY', 'STATUS', and 'LOGOUT'. A left sidebar lists various settings categories, with 'CWMP(TR-069)' highlighted. The main content area contains a form with the following fields:

- CWMP(TR-69)
- Auto Configuration Server :
- ACS User Name :
- ACS Password :
- Inform Interval : sec (1 ~ 4294967295)

'Apply' and 'Cancel' buttons are located at the bottom right of the form.

Parameter in config file & CLI

Please use >cwmp in command line. It will list the command which can be used to do some setting. Any syntax please refer to the file *TB30S_Config File CWMP flow*

File System Parameter	Valid values	Default	CLI	Description
CWMPFlag	0 disable 1 enable	0	cwmp set flag 1/0	Enable/disable cwmp TR069
CWMPACS	URL	empty	cwmp set acs acsurl	URL of the TR-069 ACS. This is the URL the phone will send TR-069 messages to. Please contact your ACS vendor to find out about this URL.
CWMPACSUser	STRING	empty	cwmp set user username	Username for HTTP authentication against the ACS
CWMPACSPassword	STRING	empty	cwmp set pwd password	Password for HTTP authentication against the ACS
CWMPConnReqUser	STRING	empty	cwmp set requester username	ACS's Connection-Request User Name
CWMPConnReqPassword	STRING	empty	cwmp set reqpwd password	ACS's Connection-Request Password
CWMPPeriodicFlag	0 disable 1 enable	1	cwmp set pflag 1/0	cwmp set pflag <on(1)/off(0)>
CWMPPeriodicInterval	Periodic Interval	180	cwmp set interval	CPE will send INFORM according to this period time
TR111STUNEnable	0 disable 1 enable	0	cwmp set stunflag 0/1	Enable or disable the stun
TR111STUNSrvAddr	IP	empty	cwmp set stunserver IP	Set CPE stun server address
TR111STUNSrvPort	Port	3478	cwmp set stunport xxxx	Set CPE stun port
TR111STUNUName	STRING	empty	cwmp set stunuser username	STUN server user name
TR111STUNpwd	STRING	empty	cwmp set stunpwd password	STUN server pwd

Note: Many other parameter is define in file: *TB30_Config File Syntax_Vxxxx_modified.doc*

For large-scale installations in case many phones need to be connected to an ACS it is strongly recommended to use the TB30 Autoprovision method. Setting the vaue in [cwmp] part in common config file. And the detail APS flow please refer to *TB30 AutoProvisioning-Vxxxx.pdf*

Supported TR069 RPC methods with TB30

List of supported RPC in TB30

Method name	CPE requirement	Server requirement	TB30 support
CPE methods	Responding	Calling	
GetRPCMethods	Required	Optional	Support
SetParameterValues	Required	Required	Support
GetParameterValues	Required	Required	Support
GetParameterNames	Required	Required	Support
SetParameterAttributes	Required	Optional	Support
GetParameterAttributes	Required	Optional	Support
AddObject	Required	Optional	N/A
DeleteObject	Required	Optional	N/A
Reboot	Required	Optional	Support
Download	Required	Required	Support
Upload	Optional	Optional	Support
FactoryReset	Optional	Optional	Support
GetQueuedTransfers	Optional	Optional	N/A
ScheduleInform	Optional	Optional	N/A
SetVouchers	Optional	Optional	N/A
GetOptions	Optional	Optional	N/A

Table.1

ACS HTTP connection flow

Using the HDM ACS will launch the TR-069 RPC on the CPE, e.g. a GetParameterValues RPC. This will result in a CWMP session between the CPE and ACS which spans several http requests/response cycles

CPE is driving the HTTP connection to the ACS, only the CPE is responsible for connection initiation and teardown.

- ◆ All transaction sessions must begin with an Inform message from the CPE contained in the initial HTTP post.
- ◆ CPE is responsible for terminating the transaction session, while the ACS could just consider the session terminated.
- ◆ This specification does not say that there should be a persistent connection between the CPE and the ACS.

See the following figure:

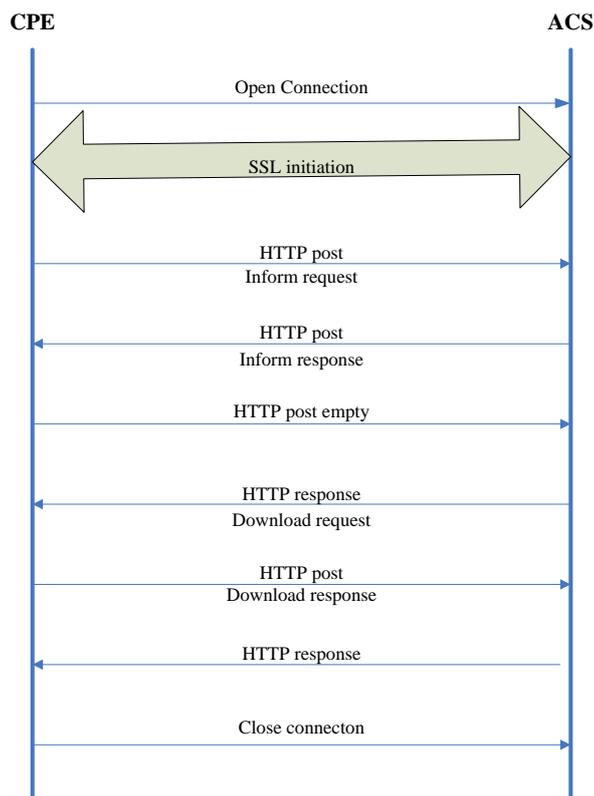

Figure 1

Supported RPC introduction

GetRPCMethods

This method may be used by a CPE discover the set of methods supported by the CPE it is in communication with. This list may include both standard methods (those defined in TR69) and vendor-specific methods. The receiver of the response MUST ignore any unrecognized methods.

GetParameterNames

This method may be used by a Server to discover the Parameters accessible on a particular CPE.

GetParameterValues

This method may be used by a Server to obtain the value of one or more CPE Parameters.

SetParameterValues

This method may be used by a Server to modify the value of one or more CPE Parameters. On successful receipt of a SetParameterValues RPC, the CPE MUST apply the changes to each of the specified Parameters immediately and atomically. The order of Parameters listed in the ParameterList has no significance. A successful response to this RPC SHOULD occur only after the new Parameter values have been successfully applied. If the CPE requires a reboot before applying the Parameter values, the CPE MUST reply before such a reboot, and thus before the Parameter values have been applied. In this case, the reply MUST come only after all validation of the request has been completed and the new values have been appropriately saved such that they will definitely be applied immediately following the reboot.

Only the attribute of the parameter is R/W, that value can be set.

GetParameterAttributes

This method may be used by a Server to read the attributes associated with one or more CPE Parameter.

SetParameterAttributes

This method may be used by a Server to modify attributes associated with one or more CPE Parameter.

Reboot

Reboot the device

Upload

This method may be used by the Server to cause the CPE to upload a specified file to the designated location.

Download

This method may be used by the Server to cause the CPE to download a specified file from the designated location. Now TB30 support below file Download:

FactoryReset

This method resets the CPE to its factory default state.

Detail description of Download

Download supported file

TB30 support most Firmware and configure file download. See detail with below table:

File type	File type string	parameter name	Type
APP/DSP/BC	1 Fireware Upgrade		
common config	3 Vendor Configuration File		
telephone config	X OUI TELEPHONECONFIG	tr069_dl_tc	string[64]
language table	X OUI LANGUAGETABLE	tr069_dl_lt	string[64]
Configuration File	X OUI COMMONCONFIG	tr069_dl_cf	string[64]
security Configuration File	X OUI SECURITYCOMMONCONFIG	tr069_dl_cf	string[64]
tone table	X OUI TONETABLE	tr069_dl_tt	string[64]
call waiting tone	X OUI CALLWAITINGTONE	tr069_dl_cwt	string[64]
melody	X OUI MELODY	tr069_dl_m	string[64]
system melody	X OUI SYSTEMMELODY	tr069_dl_sm	string[64]
security https cert	X OUI SECURITYHTTPSCERT	tr069_dl_shce	string[64]
security https ca	X OUI SECURITYHTTPSCA	tr069_dl_shca	string[64]
security https key	X OUI SECURITYHTTPSKEY	tr069_dl_shk	string[64]
security sips cert	X OUI SECURITYSIPSCERT	tr069_dl_ssce	string[64]
security sips ca	X OUI SECURITYSIPSCA	tr069_dl_ssca	string[64]
security sips key	X OUI SECURITYSIPSKEY	tr069_dl_ssk	string[64]

Restore configuration	X OUI RESTORECONFIG	tr069_dl_rc	string[64]
phone book	X OUI PHONEBOOK	tr069_dl_pb	string[64]

Table 2

There should be a URL with filename in ACS setting. Please see the below http trace. ACS will provide this URL to CPE. Then CPE will get the file from the http server. Now TB30 only support download method with HTTP.

After the download the file from HTTP server, CPE will auto reboot to activate for below the file.

1. APP FW
2. common config
3. security Configuration File
4. Restore configuration

```

HTTP/1.1 200 OK

  </soapenv:Body>
</soapenv:Envelope>

```

Figure 2

TR-111 support with TB30

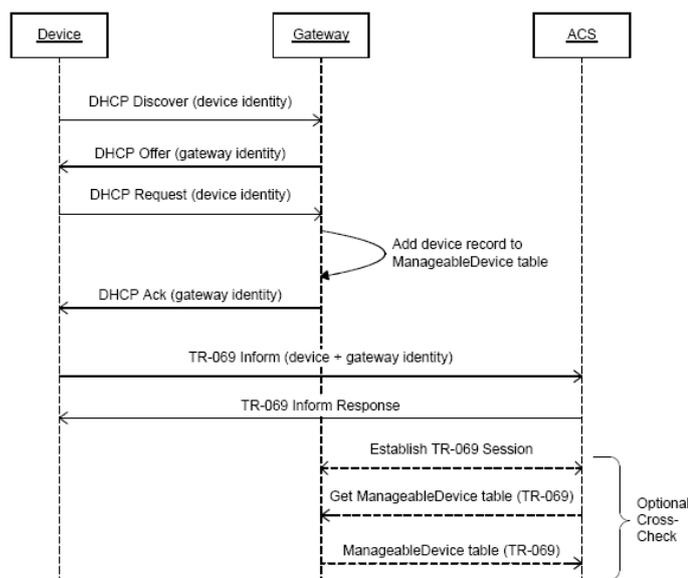

About TR-111

The TR-111 standard defines two ways of managing CPE located behind NAT routers. These CPE cannot be contacted directly using HTTP because they are not exposed to the Internet. In many cases the periodic inform interval is set to 24 hours or more. With TR-111 Parts I and II the DSL Broadband Forum defines two ways of enabling the server to contact these devices anyway.

TR-111 Part I: Device Gateway Association

The first method is to associate the phone with the modem or router it is connected to. This association is communicated to the ACS in the Inform message sent by the phone. The ACS creates port-forwarding rules on the router, which enable the ACS to contact the phone. Figure 6 shows the process of associating the phone with the router.

TR111 is supported for TB30. It aims at the CPE which is behind a NAT. ACS can initiate the connection to CPE. It is through 125 option in DHCPINFORM/DHCPDISCOVER/DHCPREQUEST to exchange the information with IGD.

Device Gateway Association

The DISCOVER request contains DHCP Option 125 with sub-options 1,2 and 3 set the respective CPE values. The DHCP OFFER response. Contains the DHCP Option 125 with sub-options 4,5 and 6 set to the respective Gateway Device options. The CPE is required to set the correct values for the following TR-069 parameters and send them in the Inform request.

TR-111 Part II: Connection request via NAT gateway

TR-111 Part II specifies a way of communicating the current NAT binding to the ACS. This method is similar to STUN.

RPC Trigger

TR069 can be triggered by the below method:

ACS initial the connect

In server side, there will be the button or some other which depends on ACS. Can trigger Get HTTP message to CPE and then CPE will connect will send the INFORM to ACS. If TR111 used, ACS will send UDP Get message

CPE initial the connect

CPE has a periodic time. If period INFORM is choose to True. CPE will active INFORM server time by time with the interval time of that value

Example

Below is an example to connect with Motive server:

1. Via command
 cwmp set flag 1
 cwmp set acs http://devhdm5.cert.motive.com:7003/cwmpWeb/CPeMgt
 cwmp set user abc
 cwmp set pwd acs
 activate
 commit
 reboot

2. Via command
 [CWMP]
 CWMPFlag=1
 CWMPACS= http://devhdm5.cert.motive.com:7003/cwmpWeb/CPeMgt
 CWMPACSUser=abe
 CWMPACSPassword=acs

3. via webpage
 Please refer to the above picture.

If you need support TR111 stun part. Please setting as below:

1. Via command
 cwmp set stunflag 1
 cwmp set stunserver 66.193.113.160
 cwmp set stunport 3478
 cwmp set stunuser username
 cwmp set stunpwd 1234
2. Via common config
 [CWMP]
 TR111STUNEnable=1
 TR111STUNSrvAddr=66.193.113.160
 TR111STUNSrvPort=3478
 TR111STUNUName=username

TR111STUNpwd=password

Any other parameter of TR111 please refer to above list.

3. Not support webpage setting

If you can see the interaction between CPE and ACS, it means the setting is active.

CPE -> ACS: http request: Inform

CPE <- ACS: http response: 401

CPE -> ACS: http request: Inform

CPE <- ACS: http response: InformResponse

CPE -> ACS: http request: Empty

CPE <- ACS: http response:204 no content

Part 14 Troubleshooting

If your phone is not operating as it should, please refer to the list of the problems in the following table. It should help you to solve the issue.

Problem	Possible cause	Remedy
No dialing tone	No connection to the LAN	Ensure that the Ethernet cable is correctly connected to the LAN port and the hub.
No display	No power.	Ensure that the power supply is correctly plugged in.
"Waiting for CA..." Message and no dialing tone	One of the following parameters is not set correctly: - Phone IP address - Call agent (CA) address - Subnet mask - Gateway address	Check these parameters with your system administrator.
Your call partner cannot hear you OR You cannot hear him.	The handset cable is not correctly plugged in.	Ensure that the handset cable is correctly plugged into the handset and the telephone
Time is not the one you've programmed.	Time is automatically specified by the network.	Ask your system administrator.
"Phone needs to be rebooted" message.	Following changes in the configuration of the phone, a reboot is needed to take effect.	Press the "OK" key to reboot the phone.
Phone does not always ring.	Call forwarding active or Do not disturb facility set.	Read the relevant section of the user guide. Deactivate the Call forward function by pressing Fwd and "enable"

Table 9.1 Troubleshooting

Part 15 Appendix

Configuration and Commands

Table 9.1 lists a minimum set of configurable parameters and commands. Parameters shall be configurable either via the auto-provisioning process, via the web-page, or via LCD menu. The Administrator will have access to all parameters, either via the web-page or LCD menu. The User will have access to a limited subset, via the web-page or LCD menu.

Configurable Parameter Or Command	Default value	Config file*	Web page		LCD menu		Comments
			Admin	User	Admin	User	
Display							
Adjustable contrast	3	x			x	x	In 1-5 range
Adjustable handset-speaker/headset/handsfree volume	3	x			x	x	In 1-5 range
Adjustable ringer volume	3	x			x	x	In 1-5 range
DTMF							
In Band	Deactivated	x	x				
Out of Band (RFC 2833)	Activated	x	x				
Ring tone number	1	x	x	x	x	x	In 1-4 range
Audio / video quality							
Voice Quality							
Voice Activity Detection (VAD)	Deactivated	x	x				
Comfort Noise Generation (CNG)	Deactivated	x	x				
Acoustic Echo Cancellation (AEC)	Activated	x	x				
Packet Loss Compensation	Activated	x	x				
Jitter buffer							
type	Adaptive	x	x				Can be Fixed or Adaptive
configurable jitter buffer length	40ms	x	x				0 to 200ms, used for both Fixed and Adaptive
Audio codecs							
g711a/μ	Choice #1; 10ms	x	x				10/20/30ms
g723.1	Choice #3; 30ms	x	x				30/60/90ms
g729ab	Choice #2; 10ms	x	x				10/20/30/40/50/60ms
Services							
User services							
Dial-out timeout	4 sec	x	x				0 sec means never dial out (only if user presses OK)
Menu language	English	x	x	x	x	x	
SNTP server	Blank	x	x		x		
Daylight saving time	Yes	x	x		x		
Selectable Time Zone	Central Europe	x	x		x		
NTP recycle timer	1 hour	x	x		x		
Maintenance							

Configuration							
Administrator Name	administrator	x	x		x		
Administrator Password	784518	x	x		x		6 Digits
User Name	user	x	x	x	x	x	
User Password	blank	x	x	x	x	x	4 Digits
Reset to factory defaults	N/A		x		x		Command
Save (upload) configuration on server	N/A		x	x			Command Saves all parameters
Protocol stacks							
Signalling							
port for sending signalling packets	2427	x	x				
port for receiving signalling packets	2427	x	x				
Addresses & names management							
Static IP	Deactivated	x	x		x		
DHCP client	Activated	x	x		x		
Subnet mask	blank	x	x		x		
Default IP gateway	blank	x	x		x		IP address or Domain Name
CA Address	blank	x	x		x		IP address or Domain Name
DNS server	blank	x	x		x		IP address or Domain Name
Backup DNS server	blank	x	x		x		IP address or Domain Name
RTP port	41000	x	x				
Same port for sending and receiving voice packets	Yes	x	x				
RTCP port	41001	x	x				
NAT							
UPnP IGD	Deactivated	x	x				
STUN server	blank	x	x				IP address or Domain Name
Remote information access							
TFTP server	blank	x	x				
FTP server	blank	x	x				
User name	blank	x	x				
Password	blank	x	x				
Quality of Service							
802.1p	5	x	x				
VLAN (802.1Q)	Activated	x	x				
ToS	5	x	x				
Diffserv	Activated	x	x				
Security							
Encryption	Deactivated	x	x				Activated : SIPS + TLS

Example of file TelConf: (Don't touch)

Not recommended to change.

Specific file MAC:

The content is the same as common_config file, except the parameter “config_sn=xxxxxxxxxxxx”, which need to be changed for each APS update.

Files Deck: (only MGCP)

Until version 1.61.4 (11 files):

Release Package Firmware

The following table show the DSP and Boot code used for different firmware.

Software Version	Firmware	DSP Code	Boot Code
V1.72	TB30S.100604.1.72.0.zz	TB30S_V2.30.1_dsp.zz	TB30S_V0.01.1_bc.zz
V1.70.4	TB30S.100204.V1.70.4.zz	TB30S_V2.30.1_dsp.zz	TB30S_V0.01.1_bc.zz

Table 7 DSP and Boot Code used
